SHUTTER

Electronic Control of the Metal Focal Plane Type

Exposure: Automatic 4 ~ 1/1000 sec. (Non stage shutter speed)
 Manual X, B, 4, 2, 1, 1/2, 1/4, 1/8, 1/15, 1/30, 1/60, 1/125, 1/250, 1/500 and 1/1000 sec.
 X 1/90 sec.
 X and B are of the mechanical control type, and are workable without batteries.

Dial: Single, non-spinning, equal space, click-stopped dial (with an automatic position lock)

Synchro Contact: JIS-B type, FP-X contact one terminal selection Hot Shoe (with an electric shock preventive)

Synchro Range: X . . . Used at X and other shutter speeds slower than 1/60 sec.
 FP . . . All speeds

Self-timer: Operating time adjustable (with a set angle index operating).
 Time - Approx. 6 ~ 10 sec.

FILM ADVANCE

Winding Method: Single-stroke winding by a lever (Winding with several small strokes are impracticable)

Winding Angle: 130° with an allowance of 30°

Spool: 4 · nail film reversal

Counter: Automatic resetting counter showing exposed frame number.

Film Rewinding: Push-stop type with R button (for automatic return) Rewinding with a crank of the folding type.

Film Loading: Locking of the back cover of the hinge type Unlocking by pulling up the rewinding knob.

Multiple Exposure: Possible by shifting to the multiple exposure lever automatic release by winding.

VIEWFINDER

Type: Eye-level viewfinder using a pentaprism.

Focusing Plate: Mat-Fresnel field focusing screen.

Visual Field Percentage: 94%
 (for the standard frame, 24 x 36mm)

Image Magnification: 84%
 (with a 50mm lens on infinity)

Unit of Measurement: -1.0 diopter

Indication in Viewfinder: Meter indication (Meter pointer and speed scale)
 Set aperture figure
 Figure of the speed dial

() Black body

EXPOSURE ADJUSTING SYSTEM

Automatic Exposure Adjustment Type with Priority to Thru - the Lens (TTL), Contrast Light Compensator (CLC) Aperture Setting

Working Range: EV1 ~ EV17 on 100 ASA film at F1.2
 EV1.5 ~ EV17 on 100 ASA film at F1.4

Meter Indication Range: 4 ~ 1/1000 sec.

Automatic Exposure: Automatic control of the exposure time by the memory circuit using IC

Film Speed Scale: ASA 12 . . . 25 . . . 50 . . . 100 . . . 200 . . . 400 . . . 1600 . . . 3200
 No DIN scale (ASA-DIN conversion plate attached to the film pocket of the back cover)

With Manual Override: +2, +1, 0, -1 and -2 EV

Coupling of Aperture Setting: MC coupler, pressed top-sidedly by the MC ring on the lens side, is coupled.
 Coupled aperture setting: 8 stages

Batteries: Silver oxide batteries 1.5V x 2
 JIS-G13 type
 S-76 (Eveready)
 MS-76 (National)
 RS-76G (Ray-O-Vac)

DIMENSIONS and WEIGHT

Dimensions: 148(W) x 97(H) x 61(L)mm
 Weight: 775g (Body only)

1. Film Advancing System

(Operating Order)

(The arrow marks indicate interlocking relations.)

Points Requiring Positioning

- Film Advance Gear (3023) ↔ Film Advance Idle Gear (3024)
- Sprocket Gear (3045) ↔ Sprocket Idle Gear (3025)
- Sprocket Axis (0190) ↔ Counter Connecting Gear (3412)
- Counter Driving Gear (3414) ↔ Counter (0142)

The film advance operating ring (0117) is checked by the film advance operation lever (0126) in the course of the film advance operation, and the film advance axis (0160) won't return. The film advance lever (0430) can be stored even in the course of the film advance operation. Since the sprocket (3041) has 6 nails, one film advance operation enables the sprocket (3041) to revolve $1\frac{1}{6}$ times.

2. Multiple Exposure System

[Operation]

1. When Multiple Exposure Lever (0350) moves in the direction of the arrow mark until (e) becomes coupled with (c), (g) of Multiple Exposure Operation Lever (3059) will be pushed by (f) and will move in the direction of the arrow mark.
2. Multiple Exposure Axis (3054) will revolve in the direction of the arrow mark due to the movement of Multiple Exposure Operation Lever (3059), and Film Advance Cancellation (0170) will move in the same direction.
3. (i) of Film Advance Nail (3014) will be pushed due to the movement of Film Advance Cancellation (0170), and Film Advance Nail (3014) will be disengaged from (h) of Film Advance Gear (3023). Thus the preparations for the multiple exposure operation will be completed.
4. When Film Advance Lever (0340) is operated, Film Advance Axis (0160) will operate. However, Film Advance Gear (3023) won't work because Film Advance Nail (3014) is disengaged. The film will remain stationary because none of Spool, Sprocket and Counter works. Only Charge Lever (0150) will work and charge Shutter (2091), making multiple exposure feasible. Immediately after the start of the operation of Film Advance Axis (0160), Film Advance Nail Spring (3029) will make Film Advance Nail Lock Plate (3070) move in the direction of the arrow mark and check Film Advance Nail (3014), and thus adequate multiple exposure will be ensured.

[Release]

1. Advance Film Advance Lever (0340) for about 130° , and (b) of Multiple Exposure Lever (0350) will be pushed by (a) of Multiple Exposure Rewind Plate, and (d) will be pushed back in the opposite direction to the arrow mark until it becomes coupled with (c).
2. When Multiple Exposure Lever (0350) is pushed back, Multiple Exposure Operation Lever (3059) will become free, and Film Advance Cancellation Spring (3055) will make Film Advance Cancellation (0170) work in the opposite direction to the arrow mark.
3. Immediately before the complete return of Film Advance Axis (0160), Film Reversion Check Nail B (3065) will make Film Advance Nail Lock Plate (3070) move in the opposite direction to the arrow mark. Then Film Advance Nail (3014) will be released, and Film Advance Nail (3014) will return to (h) of Film Advance Gear (3023). Thus with the release of multiple exposure, preparations for the film advance operation will be completed.

3. Film Advance Lever Operation

4. Release of Shutter

5. Operation of Self-Timer Lever

1. The lever will return within the range of (1), but the shutter won't be released.
2. The lever will return within the range of (2) without pressing the self-start button, and the shutter will be released.
3. The lever won't return within the range of (3). If, however, the self-start button is pressed, the lever will return and shutter will be released.
4. The lever won't return within the range of (4). It won't work even if the self-start button is pressed.
5. (5) indicates the useable range of the self-timer lever.
6. (6) indicates the full operating angle of the self-timer lever.

6. Shutter System

A. Charge System

1. Set Lever will be charged in the direction of the arrow mark by operating Film Advance Lever (0340).
2. Release Plate (b) will be pushed and charged by Set Lever (f) in the direction of the arrow mark, and (b') will be stopped by Release Lever (c).
3. Control Lever (j) will be pushed and charged by Set Lever (f') in the direction of the arrow mark, and Control Lever (j) will be stopped by Control Stop Lever (g).
4. After stopping Release Plate and Control Lever, Set Lever will return to its original position.
5. Release Plate will: (i) have (b) free Control stop Lever; (ii) have (b) push Mirror Return Stop Lever (e'), disengage Mirror Return Lever (d) and Mirror Return Stop Lever (e), and free Mirror Return Lever; and (iii) have Mirror Return Hook (a) charge Mirror Return Lever (a').
6. Control Lever will: (i) have (k) charge First Blade Moving Lever (n') in the direction of the arrow mark, have First Blade Stop Lever (m) stop (n), and charge First Blade; (ii) have (i) charge Rear Blade Moving Lever (l') in the direction of the arrow mark, have (o) stop Rear Blade Stop Lever, and charge Rear Blade; (iii) have (i') push and charge Signal Lever (r) in the direction of the arrow mark; (iv) have (h) push and move Trigger SW Lever (q) in the direction of the arrow mark, and turn off Trigger SW; and (v) have (h') disengage and move Hold Lever (p) in the direction of the arrow mark, and have Hold Lever (p') push Iron Piece Lever (t) in the direction of the arrow mark.
7. Iron Piece Lever (t) will push and charge Signal Stop Lever (s) in the direction of the arrow mark, preparations will be made for stopping Signal Lever; and thus the charging operation will be completed.

B. Electric Shutter System

1. When Shutter Button is released, Release Lever will move in the direction of the arrow mark and will be disengaged from Release Plate. Then Release Plate will move in the direction of the arrow mark.
2. The movement of Release Plate will have Mirror Moving Lever work and kick up Mirror Operating Lever (on the side of Mirror Box). Thus Mirror will be moved up, SW 5 and Magnet will be turned on, and Iron Piece Lever will be attracted.
3. The movement of Release Plate will have (a) push Control Stop Lever (c') in the direction of the arrow mark and disengage (c) from Control Lever (d), and Control Lever will move in the direction of the arrow mark.
4. The movement of Control Lever will: (i) have (d') push First Blade Stop Lever (g) in the direction of the arrow mark, disengage it from First Blade Moving Lever and have it move in the direction of the arrow mark, and First Blade will start moving; (ii) simultaneously with the start of exposure, have (f) push and move Trigger SW Lever (k) in the direction of the arrow mark, turn on Trigger SW, and have the counting of Electric Shutter started by the second; (iii) have Signal Lever (m) move in the direction of the arrow mark along (e') and release Mirror Lock Lever (on the side of Mirror Box); and have (e) push and move Hold Lever (j) in the direction of the arrow mark, release contact between (j) and Iron Piece Lever (n), and keep Iron Piece Lever idle due to its attraction to Magnet.
5. With the completion of the counting of Electric Shutter by the second, Magnet will be turned off, Iron Piece Lever will be released, and it will move in the direction of the arrow mark.
6. The movement of Iron Piece Lever will have (n) push Second Blade Stop Lever (i) in the direction of the arrow mark, release and move Second Blade Moving Lever in the direction of the arrow mark, and have Second Blade start moving. Thus exposure will come to an end.
7. Immediately before the completion of the running of Second Blade, Second Blade Moving Lever will have (h) push and move Mirror Return Lever (b') in the direction of the arrow mark.
8. The movement of Mirror Return Lever will have (b) push Mirror Return Hook, release Mirror Moving Lever, and have Mirror come down.

C. Signal System for Shortage of Voltage of Power Source

1. When the voltage of the power source falls below a certain level, Magnet won't be turned on even if SW 5 is turned on, and Iron Piece Lever won't be attracted. With the movement of Hold Lever, therefore, Iron Piece Lever will move in the direction of the arrow mark. Second Blade Moving Lever will move before the movement of First Blade Moving Lever, and Shutter won't open.
2. The movement of Iron Piece Lever will release Signal Stop Lever from (n), and enable Signal Stop Lever to move in the direction of the arrow mark. Since (p) stops Signal Lever (o) which moves along Control Lever, Mirror Lock Lever (on the side of Mirror Box) won't be released, and Mirror will remain upward.
3. Refer to Explanation on Mirror Box System and Signal Release System for Shortage of Voltage of Power Source for information on the release of Mirror Lock.

D. Operation and Synchronizing System of FP Contact

FP Contact Lever before the charging is checked by Mirror Return Lever (h) and prevents the movement of FP Contact Lever in the direction of the arrow mark.

[Charge]

1. When the charging of Set Lever starts, Release Plate will be charged in the direction of the arrow mark. Release Plate (a) will move Control Lever in the direction of the arrow mark, and (c) will stop FP Contact Lever (d).
2. With the charging of Release Plate, Mirror Return Lever will move in the direction of the arrow mark, and FP Contact Lever is going to move in the same direction. However, since FP Contact Lever is stopped by Control Stop Lever beforehand, FP Contact Lever will be prevented from moving in the direction of the arrow mark.
3. When Set Lever is charged further, (e) will stop FP Contact Lever (g).
4. When Control Stop Lever stops Control Lever, Control Stop Lever will move in the opposite direction to the arrow mark and the engagement between (c) and FP Contact Lever (d) will be released. However, since FP Contact Lever (g) is stopped by Set Lever (e), FP Contact Lever will be prevented from moving in the direction of the arrow mark.
5. Control Stop Lever will stop Control Lever and also stop FP Contact Lever again. Release Plate (b) will be stopped by Release Lever (f), Set Lever will return to its pre-charged position, and thus the charging of FP Contact will be completed.

[Operation]

1. When Shutter is released, Release Lever (e) will be released and Release Plate will move in the direction of the arrow mark. (d) will push and move Control Stop Lever (c) in the same direction.
2. The movement of Control Stop Lever will release FP Contact Lever (f), which will, in turn, move in the direction of the arrow mark. Then FP Contact will be turned on.
3. Second Blade Moving Lever will move in the direction of the arrow mark. Immediately before the completion of the running of Second Blade, (a) will push and move Mirror Return Lever (b) in the direction of the arrow mark, and (h) will push and move FP Contact Lever (g) in the opposite direction to the arrow mark. Then FP Contact will be turned off.

E. Operation and Synchronizing System of X Contact

X Contact Lever before the charging will be stopped by Second Blade Moving Lever (a), and X Contact Lever will be prevented from moving in the direction of the arrow mark.

[Charge]

1. When the charging of Control Lever starts, First Blade Moving Lever will be charged in the direction of the arrow mark. First Blade Moving Lever (b) will release and move X Connecting Lever in the direction of the arrow mark, and (c) will stop X Contact Lever (d).
2. The movement of Control Lever will move Second Blade Moving Lever in the direction of the arrow mark. X Contact Lever is going to move in the direction of the arrow mark, but won't be able to do so because it is stopped by X Connecting Lever beforehand.
3. The further movement of Control Lever will stop First Blade Moving Lever and Second Blade Moving Lever. Thus the charging of X Contact will be completed.

[Operation]

1. When Shutter is released, First Blade Stop Lever (e) will be released and First Blade Moving Lever will move in the direction of the arrow mark. Immediately before the completion of the running of First Blade, First Blade Moving Lever (d) will push and move X Connecting Lever (e) in the direction of the arrow mark.
2. The movement of X Connecting Lever will release X Contact Lever (f), which will, in turn, move in the direction of the arrow mark. Then X Contact will be turned on.
3. Second Blade Moving Lever will move in the direction of the arrow mark. Immediately before the completion of the running of Second Blade, (a) will push and move X Contact Lever (h) in the opposite direction to the arrow mark. Then X Contact will be turned off.

[Charge]

[Operation]

F. Mechical Shutter System

When Shutter Speed Dial stays at the auto or the manual (4-1/1000 sec.) position, Mech. Time Operation Lever (on the side of Body) will move in the direction of the arrow mark. Mech. Time Lever (b) will be pushed and suspended by (a).

When Shutter Speed Dial is positioned at X or B, Mech. Time Operation Lever will be released.

[Charge]

1. When the charging operation starts, First Blade Moving Lever will be charged in the direction of the arrow mark. First Blade Moving Lever (f) will release and move X Connecting Lever in the direction of the arrow mark.
2. The movement of X Connecting Lever will release and move Mech. Time Lever in the direction of the arrow mark. Iron Piece Lever will be pressed to Magnet in the direction of the arrow mark, and Mech. Time Lever (d) will suspend Iron Piece Lever (c).

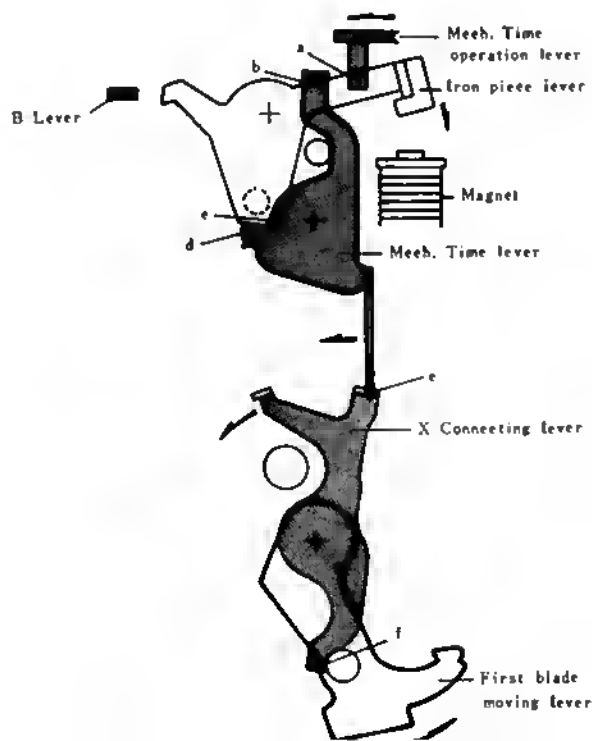

(X Operation)

1. When Sutter is released, First Blade Moving Lever will move in the direction of the arrow mark. Immediately before the completion of the running of First Blade, (d) will push and move X Connecting Lever (e) in the direction of the arrow mark.
2. The movement of X Connecting Lever will enable (c) to push and move Mech. Time Lever (b) in the direction of the arrow mark. The engagement (f) with Iron Piece Lever will be released, and Iron Piece Lever will move in the direction of the arrow mark. Then the suspension of Second Blade will be released.

(B Operation)

1. When Shutter Speed Dial is positioned at B, the suspension of B Lever (on the side of Body) will be released.
2. When Shutter is released, B Lever will move in the direction of the arrow mark. Iron Piece Lever (a) will be suspended. Even when the engagement (f) of Mech. Time Lever and Iron Piece Lever is released, Iron Piece Lever will be prevented from moving in the direction of the arrow mark.
3. When Shutter Button moves up, B Lever will move in the opposite direction to the arrow mark, and the suspension of Iron Piece Lever will be released.

[Charge]

[X. B Operation]

7. Mirror Box System

A. Mirror Retaining System at 45°

Connection Plate remains free before or after the film advancing operation. Mirror Operation Lever will be pushed down in the direction of the arrow mark. On the strength of Mirror Return Spring, Mirror Holder, coupled with Mirror Operation Lever (a), will be retained 2 Mirror Angle Adjusting Plates, Mirror Angle Adjuster Plate and Mirror Stopper, and mirror angle will be kept at 45°. (Fig.1)

B. Mirror Lifting and Lowering System

When Shutter Button is released, the engagement (c) of Release Lever and Release Plate will be released. Simultaneously with the movement of Release Plate in the direction of the arrow mark, Mirror Moving Lever will move and (b) will push up Connection Plate. Then Mirror Operation Lever will move in the opposite direction to the arrow mark, and (a) will lift up Mirror Holder. (Fig.1) When Last Blade closes following the operation of Shutter, Mirror Moving Lever will become free. Mirror Operation Lever will be pushed down in the direction of the arrow mark on the strength of Mirror Return Spring, and (a) will lower Mirror Holder. (Fig.1)

C. Signal Cancellation System for Shortage of Voltage of Power Source

When Shutter is released below a certain level of the voltage of the power source, it won't open and First Blade and Last Blade and Last Blade will run simultaneously. With a view to giving an alarm, therefore, Signal Lever (c) won't be released. Mirror Operation Lever will be suspended by Mirror Lock Lever (d), and Mirror Holder won't come down. When Shutter Speed Dial is positioned at B or X, Signal Cancellation Lever will move in the direction of the arrow mark, and (a) will push and move Mirror Lock Lever (b) in the direction of the arrow mark.

Then the engagement (d) will be released, and Mirror Holder will come down. (Fig.2) (Refer to Electric Shutter System.)

D. On-Off System of SW5

The movement of Connection Plate in the direction of the arrow mark will enable Mirror Operation Lever to move in the direction of the arrow mark. (a) will also move Auxiliary Brake in the same direction, and both SW5 and Magnet will be turned on. Immediately before the completion of the lowering of Mirror Holder, Mirror Operation Lever (a) will move Auxiliary Brake in the opposite direction to the arrow mark, and both SW5 and Magnet will be turned off. (Fig.3) (Refer to SW.)

Fig-1

Fig-2

Fig-3

E. Automatic Diaphragm and Return System

When Connection Plate begins to move in the direction of the arrow mark, Return Lever will move in the same direction via MP Moving Lever. P Lever Adjuster Pin will move Preset Lever in that direction, too, via P Connection Plate. Then Lens Side Preset will be freed, and the lens will be set to the prescribed aperture.

The movement of Return Lever in the direction of the arrow mark will be retarded by P Brake Lever, Wheel G and Fly Wheel, and the aperture of the auto preser lens will be stabilized. When Last Blade closes following the operation of the shutter, Return Lever will move in the opposite direction to the arrow mark and shift Preset Lever in the same direction via P Connection Plate and P Lever Adjuster Pin. Then Lens Side Preset will be pushed back, and the diaphragm will be opened.

F. On-Off System of SW 2, SW 3 and SW 4

The movement of Return Lever in the direction of the arrow mark will shift SW' Change Lever in the direction of the arrow mark via Change Lever Pin A. Then SW 2 and SW 3 will be turned off, while SW 4 will be turned on. When Return Lever is released following the operation of the shutter, SW 2 and SW 3 will be turned on, while SW 4 will be turned off.

G. Diaphragm and On-Off System of PV SW

When Preview Button is pressed, the open light measurement will become possible. When the button is pressed further, Lens Opening Retention Lever will move in the direction of the arrow mark. The suspension of Diaphragm Plate Axis B will be released, and Diaphragm Plate will move in the direction of the arrow mark and shift Prest Lever in the same direction via Diaphragm Pin, and light can be measured through the diaphragm.

The movement of Diaphragm Plate will enable P Lock Lever to move in the direction of the arrow mark. Preset Second Lever will be suspended, and the operation of the mirror will be retarded when an aperture is set.

When light is measured through the diaphragm, Preview Button will remain unpressed. When it is pressed, Lens Opening Retention Lever will be suspended by Diaphragm Plate Axis B. P Lock Lever will move in the direction of the arrow mark, and the suspension of Present Second Lever will be released. Preset Lever will move in the direction of the arrow mark, and the open light measurement will become possible.

The movement of Diaphragm Plate will turn PV SW on and off. PV SW will be turned on for the open light measurement and will be turned off for the light measurement through the diaphragm. (Refer to SW.)

[Automatic Diaphragm and Return System]

[On-Off System of SW 2, SW 3 and SW 4]

[Diaphragm and On-Off System of PV SW]

8. Exposure Interlocking System

When an aperture figure of Diaphragm Ring is set, Diaphragm Contact (4105) will get in touch with Diaphragm Resistor (4118) via Diaphragm Pulley (0211). Then a resistance figure corresponding to the set aperture figure will be set, and it plus the resistance figure on the ASA side will be transmitted to the circuit side as the exposure factor.

Note: Diaphragm SW will be turned on only for the open light measurement.

10. Explanation of Light Measuring Principle and Circuits

A. Summary

• Light Measuring Systems

The measurement of light is roughly divided into 2 systems—the TTL light measuring system as represented by X-1 (XM and XK) and the outer light measuring system by Hi-MATIC E. In the case of the TTL measuring system, automatic exposure is possible only with the time set circuit comprising the CdS and the condenser and with the switching circuit. The reason is that the resistance value does not change or block light to the CdS.

In the case of a single reflex camera of the TTL measuring system, its circuits, if constructed like those of the outer light measuring system, won't be able to achieve automatic exposure, because its operation (automatic aperture setting and mirror operation) will change or block light to the CdS. Therefore, it is necessary to memorize the results of the TTL measurement immediately before the release of the shutter so that the effects of the automatic aperture setting and the mirror operation may be prevented.

• Memory Systems

A variety of memory systems are conceivable. A system of charging the condenser with the results of the light measurement and memorizing the charged voltage is adopted for XE as well as for X-1.

In addition to this memory system, XE has a more complicated construction and needs more accurate components and adjustments than cameras with lens shutters of the electronic control type such as Hi-MATIC E and F, because it has wide ranges of the light measurement and the film sensitivity, and because it requires the interchangeability of various lenses and attachments.

• Automatic Exposure Control Systems

The automatic exposure control system for XE will be explained according to the block diagram.

a. Light Measuring System

The automatic exposure control system for XE is the same as that for E-1. It is designed to obtain adequate exposure by setting the ASA number, the aperture figure and the exposure correcting figure and by automatically determining the exposure time on the basis of these figures and the brightness of the object. First, it will mechanically add the ASA number

in which the rotary angle per step is logarithmically compressed at a certain constant (graduations at equal intervals), and the exposure correcting figure, will add these figures to the aperture which is logarithmically compressed as well as the ASA number, figure, via the metal-covered resistor, and at the same time, will convert the sum into an electric volume (voltage).

The electric value (voltage) will be added to another electric volume (voltage) in which the brightness of the object is logarithmically compressed by the photoelectric converting part (C part of the circuit) made up of 2 CdS and several resistors. The sum will be equivalent to the exposure time, and will be charged to (memorized by) the condenser (C_1 of the E part of the circuit). On the other hand, the exposure time will be indicated in the finder by the meter via the indication circuit.

b. Control System

Next, when released, the light measuring output point and the condenser (C_1) will be separated from each other by the memory switch (D part of the circuit diagram), and the measured light quantity (voltage corresponding to the exposure time) immediately before the release will be memorized.

Light to the CdS will be converted by the automatic diaphragm and the mirror operation. Even when the light measuring output voltage may change because of the blocking of light, the charged voltage of the memory condenser (C_1) won't be affected and the memory will be accurately kept. When the operation of the camera advances further, the first curtain will begin to run, the relative trigger switch will work, and the memorized quantity (logarithmically compressed quantity) will be converted into a logarithmically extended current. Then the current will be charged to the condenser (C_2). When the voltage reaches a certain level, the first switching circuit (F of the circuit diagram) and the delay circuit (I of the current diagram) will work one after another. After a certain length of time, the second switching circuit (J of the circuit diagram) will work, the current of the magnet (K of the circuit diagram) will be cut off, and the second curtain will run. Thus the exposure will be completed.

• Manual Time

In the case of the manual time, the memory will be switched from the logarithmic extension circuit (F of the circuit diagram) to the manual resistor (G of the circuit diagram) in order to form the CR time set circuit. Then the exposure will be controlled in the same way as the automatic control system.

Note: Exposure correction means an increase or decrease of a certain figure (up to 2Ev) to or from the standard exposure in the case of automatic photography. For example, a "+1" exposure correction means to add 1Ev to the standard exposure.

B. Logarithmic Compression and Addition

• Logarithmic Compression

Logarithmic compression is necessary to determine the adequate exposure. Variations are usually given in the manner of geometric progression to those in the ASA number, the aperture figure, the exposure time, etc. (For example, 2Ev, 4Ev . . . are given to 1Ev, 2Ev . . . , respectively; 25, 50, 100, 200 . . . for the film sensitivity figure; and 1 sec., 1/2 sec., 1/4 sec. . . for the exposure time.) Since the power source needs a high voltage to convert such figures that will change in the manner of geometric progression, no camera can practically afford to have so high a voltage. Then it becomes necessary to convert variations in the Ev-figure to those given in the manner of arithmetical progression (for example, 1Ev, 2Ev, 3Ev . . . to 1, 2, 3 . . .). This sort of conversion means logarithmic compression.

[Example] If the exposure time of 1-1/1000 sec. is converted into a voltage at the rate of 0.1V per second without giving logarithmic compression, 1/1000 sec. will be: $0.1V \times 2^{10} = 102.4V$. If, however, 1/1000 sec. is logarithmically compressed, the obtained figure will be: $0.1V \times 10 = 1V$, or less than 1/100 of the 102.4V. This small figure is quite practical for cameras.

An explanation will be given about how the following factors can be logarithmically compressed:

a. Film Sensitivity, Exposure Correction and Aperture Figures

As mentioned before, the ASA number changes in the way of 25, 50, 100, 200 . . . When the set dial is graduated at equal intervals (rotary angle per step), the rotary angle of the dial will respond to the shift of the brush of the metal-covered resistor with a linear property (A and B of the circuit diagram), and these figures will be converted to resistance values (voltages) which change in the manner of arithmetical progression. Similar methods are used for the exposure correction figure and the aperture figure.

b. Brightness of Object

As apparent from the circuit diagram shown later, in the photoelectric conversion circuit (C of the circuit diagram) comprising 2 CdS and several resistors, the brightness of the object will be electrically converted and logarithmically compressed thanks to the special property of these CdS and the special construction of the circuits. No diode or transistor is used for logarithmic compression.

c. Exposure Time

The exposure time will be memorized as the logarithmically compressed output of the light measuring circuit by adding the before-mentioned factors in the manner of logarithmic compression.

● Addition

As stated previously, all factors in determining the adequate exposure are added in the manner of logarithmic compression. First, the ASA number and the exposure correction figure will be mechanically obtained.

Then they will be added to the aperture figure and the total will be electrically converted simultaneously via the metal-covered resistor (A and B of the circuit diagram).

Further, the addition of the total to the brightness of the object will be electrically made in a circuit with IC-B as the nucleus. This sort of mechanical adding system is called the adding system, while that of electrical adding system is called the addition circuit.

C. Memory

Since light is measured after its passage through the take lens, its reflection on the mirror, and its passage through the focus plate, light to the CdS is changed or blocked by the automatic diaphragm and the mirror operation. Therefore, it is necessary to withhold the light value measured immediately before the release operation in connection with the operation itself. The memory means to withhold the measured value.

In the case of XE, the condenser C_1 (E of the circuit diagram) will be charged. The memory switch (D of the circuit diagram) will open along with the release operation, and the charged voltage will be withheld (memorized). This sort of circuit is called the memory circuit.

D. Logarithmic Extension

As mentioned before, the electric volume (voltage) corresponding to the exposure time is memorized in the form of a logarithmically compressed figure. Therefore, the volume must be converted into an adequate exposure time (1, 1/2, 1/4 sec. or else). This sort of conversion is called logarithmic extension (or simply extension). In the case of XE, the memorized voltage will be converted into a current in the manner of logarithmic extension by utilizing the special property of the transistor (F of the circuit diagram). The condenser C_2 constituting the time set circuit will be charged with the logarithmically extended current, and the control of the magnet will convert the current into the required exposure time via the subsequent switching circuits.

E. First Switching, Delay and Second Switching Circuits

Generally speaking, the adequate exposure time cannot be easily obtained for the focal pressure shutter simply by electrically controlling the time (1 ms in the case of 1/1000 sec.) corresponding to the exposure time, because there is an overlap between the first and the second curtains. Therefore, the circuit construction is in the operational order of the first switching circuit, the delay circuit and the second switching circuit. In conjunction with the logarithmically extended part (E of the circuit diagram) and the time set circuit comprising the condenser C_2 or the manual resistor (G of the circuit diagram) plus the condenser C_1 , the first switching circuit (H of the circuit diagram) will control the time (1 ms in the case of 1/1000 sec.) equal to the exposure time. The combination of the delay circuit (I of the circuit diagram) with the second switching circuit (J of the circuit diagram) will delay a certain length of time (constant irrespective of the exposure time) equivalent to the "zero" time of the overlap between the two curtains, and will obtain the exposure time by controlling the magnet. This delay action is mechanically possible by making the operation of the trigger switch well timed, but is much easier by an electric method. This is the reason why the electric delay circuit is used as shown in the circuit diagram.

F. Indication Circuit and Meter

The indication circuit is intended to amplify the output of the addition circuit and to operate the meter inside the finder.

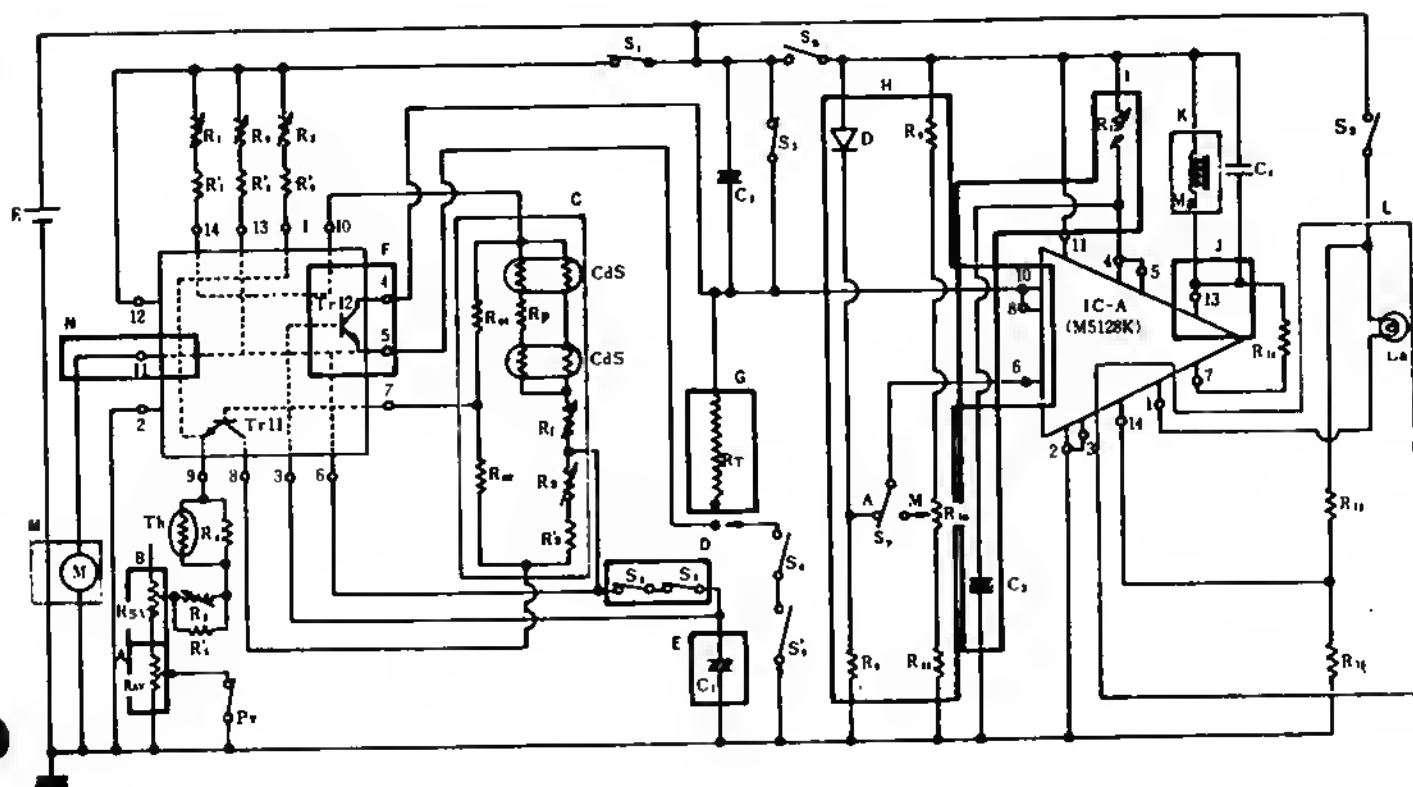

G. Manual Resistor

In the case of automatic exposure, the first switching circuit will be controlled by a signal received from the extension circuit. In the case of manual exposure, however, it is connected with the CR time set circuit. In this case, a resistance value (1/1000 sec. is small and 4 sec. are large) equivalent to a certain exposure time (shutter speed) will be set to the condenser C.

H. Battery Check Circuit

The battery check circuit is intended to check the voltage of the power source. The lamp will light within the range (voltage) of the accurate control of the exposure time. The consumed current is the same as what is consumed for the operation of the camera. The lamp will light up to about 2.0V.

11. Circuit Diagram and Properties of Switches

A: Aperture Figure
B: ASA Number and Exposure
Correction Figure
C: Brightness of Object

C₁: Memory Condenser (2.2 μ F)
C₂: Condenser (1.0 μ F) for CR Time
C₃: Condenser (0.1 μ F) for Delay Circuit
C₄: Condenser (0.05 μ F) for Prevention
of Reverse Generation of Magnet
D: Diode for Setting Trigger Level
upon Automatic Exposure
La: Checker Lamp

R₁₀: Semi-Fixed Resistor (68K Ω) for Setting
Trigger Level upon Manual Exposure
R₁₅: Resistor (1K Ω) for Battery Checker
R₁₆: " (630 Ω) "
R₁₂: Semi-Fixed Resistor (40K Ω) for Delay

Mark	Name	Operation	Operating Condition	Before Release	During Exposure	After Exposure
S ₁	Main Switch	The light measuring operation starts when automatic light the measuring circuit is turned on. The meter indicates the shutter time. (The A base plate circuit is turned on.)	(Interlocked with the main switch.)	(ON)	(ON)	(ON)
S ₂	Memory Switch	S ₂ will keep the memory even after S ₂ returns.	To return immediately after the completion of the exposure. (Interlocked with the mirror operation lever.)	ON	OFF	ON
S ₂	Memory Second Switch	This switch will be turned off immediately before the release of the shutter. Then the logarithmically compressed light value ($T_v = S_v + B_v - A_v$) will be memorized by the memory condenser before variations in the light value to be caused by the lifting of the mirror.	To be turned off immediately before the release of the shutter. (Interlocked with the shutter release axis.)	ON	OFF	ON
S ₃	Condenser Discharge Switch	This switch will enable the condenser to discharge its electric load for both the manual and automatic operations.	The operation interval between S ₃ and S ₄ should be stable. (Interlocked with the mirror operation lever.)	ON	OFF	ON
S ₄	Second Switch for Start of Control of Exposure Time.		To be turned on before S ₄ . (Interlocked with the mirror operation lever.)	OFF	ON	OFF
S ₄	Switch (Trigger Switch) for Start of Control of Exposure Time	This switch will start counting the exposure time for both the manual and automatic operations.	Chattering should be eliminated because it has adverse effects on the stability of the shutter speed. Even if chattering cannot be eliminated, the shutter speed should remain stable. (Shutter block)	OFF	ON	OFF (Completion of the film advance.)
S ₅	Switch for Start of Attraction of Magnet	This switch will make the magnet attractive. (The B base plate circuit is turned on.)	To minimize chattering as much as possible. (Interlocked with the mirror operation lever.)	OFF	ON	OFF
S ₆	Battery Checker Switch	This switch will check the battery.	(Interlocked with the battery checker lever.)	No relations		
S ₇	AM (Automatic and manual exposure) select Switch	This switch will change circuits for the automatic or the manual exposure.	(Interlocked with the shutter dial.)			
Pv	Pre-View Switch	This switch will prevent an erroneous exposure operation upon the open light measurement or the measurement through the diaphragm.				
FP	Switch for Ignition of Flash	This switch will ignite the flash.	To be turned on 11-15ms before the run of the first curtain, and to be turned off upon the completion of the run of the second curtain.	OFF	ON	OFF
X	Switch for Ignition of Stroboscope	This switch will ignite the stroboscope.	To be turned on upon the completion of the run of the first curtain and to be turned off upon the completion of the run of the second curtain.	OFF	ON	OFF

12. Explanation of Circuits

A. Control Circuit

When the main switch (S_1) is turned on, the addition and the indication circuits will work, and the meter's pointer will swing.

A constant current of $25\mu\text{A}$ usually flows through the addition circuit. The bridge circuit comprising the light receiving element (CdS) and resistors (R_{01} , R_{02} , R_s , R_s' and R_1) obtains an output of 18mV per Ev.

The current of $25\mu\text{A}$ will be adjusted by R_1 , the common terminal of the CdS (on the lens side) will be opened (removed), and a decrease in the voltage of R_{02} will be measured.

$$\begin{aligned}\text{That is to say: } 25(\mu\text{A}) \times 15.5(\text{K}\Omega) &= 25 \times 10^{-6} \times 15.5 \times 10^3 \\ &= 387.5 \times 10^{-3} \\ &= 387.5\text{mV}\end{aligned}$$

The constant current of $25\mu\text{A}$ will pass through Tr_{11} via the CdS circuit and join another constant current of $8\mu\text{A}$ coming from R_2 . Then the two ($25\mu\text{A} + 8\mu\text{A} = 33\mu\text{A}$) will flow to the earth via ASA (R_{sv}) and the diaphragm resistor (R_{AV}).

At a resistance value of about 540Ω per Ev, the slide resistors ($R_{sv} + R_{AV}$) will become:

$$\begin{aligned}540\Omega \times 33\mu\text{A} &= 540 \times 33 \times 10^{-6} \\ &\approx 18 \times 10^{-3}(\text{V}) \\ &\approx 18\text{mV}\end{aligned}$$

Then they will transmit information on the ASA and the aperture to the addition circuit.

R_{AV} and R_{sv} cause a problem because of a difference in their properties. For example, the 8-step conversion volume of R_{AV} will be: $540\Omega \times 8 \times 33(\mu\text{A}) = 540 \times 8 \times 33 \times 10^{-6} \approx 143 \times 10^{-3}(\text{V}) = 143(\text{mV})$ However, the 7% difference in its property will cause an error: $143\text{mV} \times 0.07 \approx 10(\text{mV})$ $10/18 \approx 0.5\text{Ev}$. Therefore, a constant current of $8\mu\text{A}$ will be corrected by R_2 and the output will be stabilized.

The output obtained in the addition circuit can be obtained from the midcontact point between R_1 and R_s in the CdS circuit.

The memory switches (S_2 and S_2'), when turned on, will charge the memory condenser (C_1) with the output of the addition circuit.

When the shutter is released, each switch will work as shown in Table 1. When S_2' is turned off, C_1 will be separated from the addition circuit and memorize the given information.

When the shutter button is further pressed, the mirror moving system will work, S_3 will be turned on to activate the first switching, the delay and the second switching circuits, the magnet will be energized, and the second curtain will be suspended.

Table-1

The movement of the shutter mech. block will turn on S_4 (trigger switch) in connection with the run of the first curtain, and C_2 will start charging via the extension circuit. On this occasion, the current will flow through the plus electrode, C_2 , Tr for extension, S_4 , S'_4 and the minus electrode. The arithmetically compressed voltage against the brightness of the object, which was charged to C_1 , will be converted in the manner of geometrical progression.

No. 10 and No. 6 terminals of the IC constitute the differential amplifying circuit (first switching circuit) in the IC. No. 6 terminal (trigger level) will be usually stabilized at about 1.6V for the manual operation and at about 2.5V for the automatic operation.

When S_4 is turned on, the voltage of No. 10 terminal will decline because C_2 is charged with the 3V of the power source and will reach the same value as the trigger level of No. 6 terminal. Then the differential amplifying circuit will turn reversely.

With the reverse turn of the first switching circuit, the delay circuit (C_3) will be charged via R_{12} . When the charged voltage becomes a half of the voltage of the power source, the second switching circuit will turn reversely. Then the current of the magnet connected to No. 13 terminal will be blocked, and the second curtain will run.

For the manual release of the shutter, the R_t tip resistance will arise from the extension circuit by operating the A-M select switch, and the CR time set circuit will be made up of C_2 and R_t . However, the circuit operation will be the same as that for the automatic release of the shutter.

B. Meter Circuit

The meter circuit is designed to amplify the output of the addition circuit and to operate the meter. It is contained in the IC for the light measurement and the memory circuits. Its output is the memory voltage of No. 6 terminal and its input is the voltage of No. 11 terminal. The swinging volume of the ammeter with an internal resistance of $1.2K\Omega$ varies depending on the combination of IC, CdS, etc., but will be adjusted by R_2 .

Disassembly, Assembly and Adjustment of the Shutter

	Page
1. Disassembly and Assembly	1 ~ 4
2. Adjustment of the Shutter Block.....	4
① Adjustment of the 1st curtain and its speed.....	5
② Adjustment of the force of the control lever (synchro "FP" time lag.)	5
③ Adjustment of the 2nd curtain and its speed.....	5
④ Adjustment of the manual time	5
⑤ Adjustment of the synchro "X" time lag	7
3. Special tool and Sub Material.....	7

Disassembly & Assembly-1

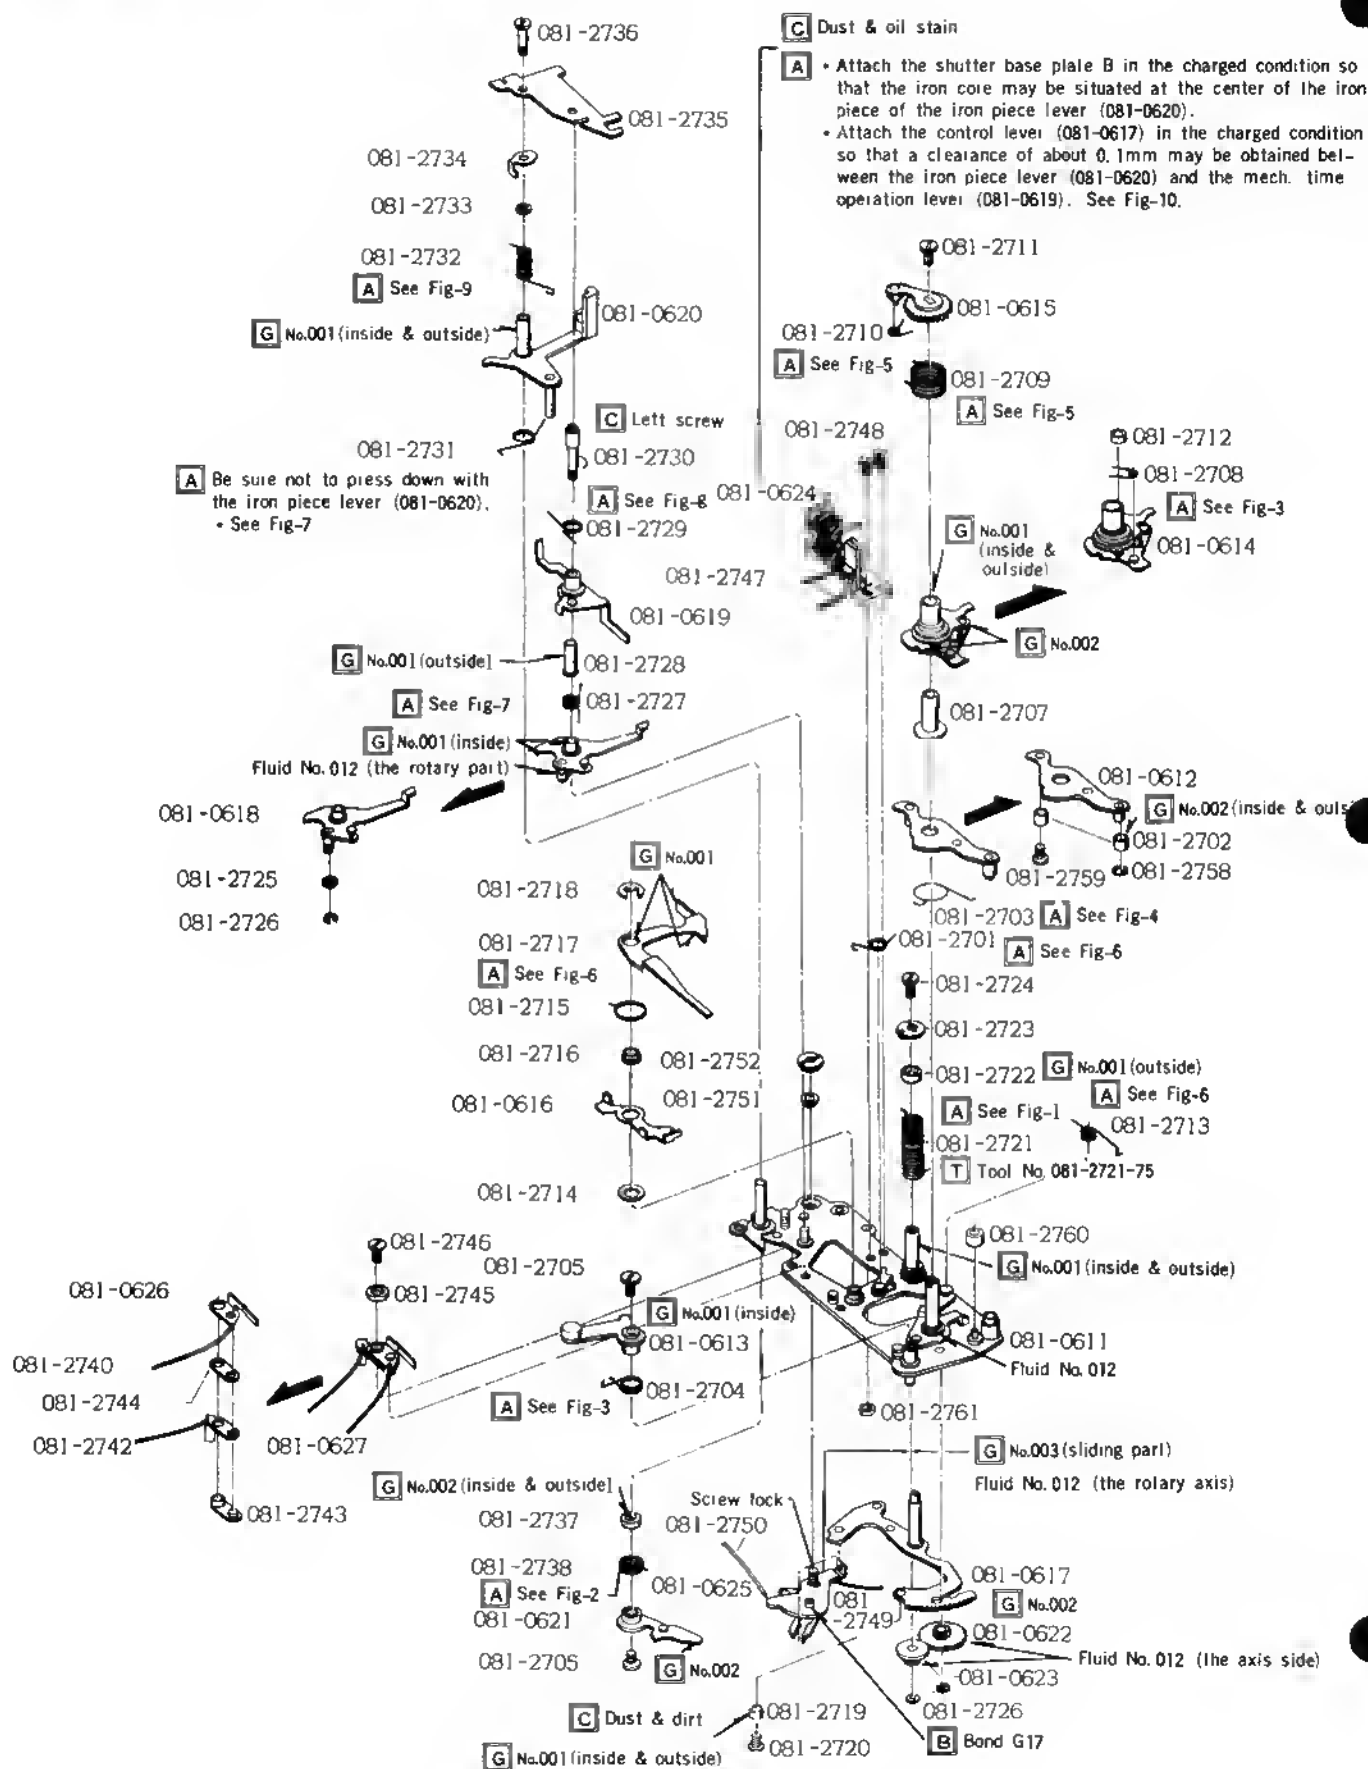

Fig-1

- Using the special tool (Tool No. 081-2721-75), turn the gear round in the direction of the arrow mark, and set it at the position shown in the diagram.

Fig-2

Fig-3

Fig-4

Fig-5

- Turn the gear round in the direction of the arrow mark, and set it as the position shown in the diagram.
- If the spring is strong the body time lag won't be secured.
- If the spring is weak, the mirror won't move up.

Fig-6

Fig-7

Fig-8

Fig-9

The upper side of the shutter

- Turn 2734 round in the direction of the arrow mark, and set it at the position shown in the diagram.
- If the spring is strong, it won't be pushed enough by the hold fever spring (081-2738) and won't be pressed to the Mg.
- If the spring is weak, it may not be uniformly separated the Mg, causing speed variations.

Fig-10

Disassembly & Assembly-2

- D** Remove the shutter in the charged condition by setting the set lever in the direction of the arrow mark.
- A** Charge both the front and rear blades, and set the "X" contact lever (081-0605) clockwise. Assemble the shutter base plate in the charged condition by setting the mech. time operation lever (081-0619) and the set lever (081-0612) in the direction of the arrow mark.

Arrangement of lead wires

■ **After assembly:** Attach the shutter block to the body, and then attach the shutter base plate (081-0270) and the winding lever (081-0340). (See Page. 13~15 of the disassembly, assembly, and adjustment manual.)

- **Confirmation:**
1. Operation of the mech. shutter.
Set the speed dial to "B" and "X", and then release the shutter. Be sure to confirm that the rear blade is locked at "B", while the shutter opens at "X".
 2. Confirm the attractive force of the Mg.
(See Page. 49 of the disassembly, assembly, and adjustment manual.)

Fig-11

■ Adjustment of the Shutter Block

■ Items to be Adjusted

1. Adjustment of the 1st curtain and its speed.
2. Adjustment of the force of the control lever (synchro "FP" time lag.)
3. Adjustment of the 2nd curtain and its speed.
4. Adjustment of the manual time.
5. Adjustment of the synchro "X" time lag.

■ **Testers** The 081 standard circuit meter (Model SC-1)
 The digital time counter (Model TC-1)
 The shutter tester

■ **Diagram of the connections between the testers and the shutter block**

1 Adjustment of the 1st curtain and its speed

■ **Standard Value:** Shutter tester 21mm 6.0ms.

■ **How to Adjust:**

1. Connect the lead wires of SW. 4 and Mg of the shutter block as shown in the diagram of the connections between the testers and the shutter block, and set the testers as explained below:

● 081 Standard Circuit Tester	● Shutter Tester
SS SEL: 1/1000	Curtain running direction: Down
V SEL: 3.0V	Function: Run. T or 1st Run. T
2. Set the speed dial at a position other than "B" and "X", and adjust the 1st blade driving spring so that the shutter may show the standard value when released by pressing "RESET" SW of the 081 standard circuit tester.
The fore blade driving spring will be changed up to about 0.1ms by the gear 1.

2 Adjustment of the force of the control lever (Synchro "FP" time lag)

■ **Standard Value:** 14 ms (11~15 ms)

■ **How to Adjust:**

1. Connect the lead wires of SW. 4 and Mg of the shutter block and those (blue) of the synchro "FP" as show in the diagram of the connections between the testers and the shutter block, and set the testers as explained below:

● 081 Standard Circuit Tester	● Shutter Tester
SS SEL: 1/1000	Curtain running direction: Down
V SEL: 3.0V	Function: FP
2. Set the speed dial at a position other than "B" and "X", and adjust the control lever spring so that the shutter may show the standard value (14 ms) when released by pressing "RESET" SW of the 081 standard circuit tester. The time lag will be come shorter when the control lever spring is made stronger, and vice versa.

3 Adjustment of the 2nd curtain and its speed

■ **Standard Value:** Shutter tester 21mm 6.0ms

■ **How to Adjust:**

1. Connect the lead wires of SW. 4 and Mg of the shutter block as shown in the diagram of the connections between the testers and the shutter block, and set the testers as explained below:

● 081 Standard Circuit Tester	● Shutter Tester
SS SEL: 1/1000	Curtain running direction: Down
V SEL: 3.0V	Function: Run. T or 2nd Run. T
2. Set the speed dial at a position other than "B" and "X", and adjust the 2nd blade driving spring so that the shutter may show the standard value when released by pressing "RESET" SW of the 081 standard circuit tester.
The 2nd blade driving spring will be changed up to about 0.1ms by the gear 1.
3. Set the shutter tester to "Function: EXP. T", and release the shutter.
In this case make a readjustment so that the measured value of the "A" range may become equal to that of the "C" range.

4 Adjustment of the manual time

■ Standard Value:

"SS SEL" Set position of 081 Standard Circuit Tester	Indication of Shutter Tester		CR Time
	Standard Value	Allowable Value	
1/1	1000 ms	758~1320 ($\pm 0.4\text{EV}$)	1 s
1/4	250 ms	189~330 ($\pm 0.4\text{EV}$)	251 ms
1/1000	0.98 ms	0.91~1.05 ($\pm 0.1\text{EV}$)	2 ms

Note: The allowable value is the central value of the tester.

Refer to the inspection standards for variations.

■ How to Adjust:

1. Connect the lead wires of SW. 4 and Mg of the shutter block as shown in the diagram of the connections between the testers and the shutter block, and set the testers as explained below:

● 081 Standard

Circuit Tester

SS SEL: 1/1000

(1/4, 1/1)

V SEL: 3.0V

● Shutter Tester

Curtain running

direction: Down

Function: EXP. T

● Digital Time Counter

SEP-COM SW: SET

Trigger level: A-CH: +1 (V)

B-CH: +1 (V)

Trigger slope: A-CH: +

B-XH: +

2. Set the speed dial at a position other than "B" and "X", and set the 081 standard circuit tester to "SS SEL: 1/1000". Then adjust the eccentric pin of the trigger switch so that the shutter may show a value close to the standard value (0.98 ms) when released by pressing "RESET" SW.

The Value will be come smaller when the eccentric pin is turned clockwise, and vice versa.

3. If no adjustment is possible with the trigger switch, readjust the force of the control lever (within the standards of the synchro "FP" time lag) so that the value may become close to the standard value (0.98 ms).

4. Set the 081 standard circuit tester to "SS SEL: 1/4, 1/1", and confirm that the shutter shows a value within the standard value range when it is released, as is the case with 1/1000.

Note: The indication of the digital time counter varies a little depending on the chattering of SW. 4.

■ Relations between variations in the force of the

control lever on one hand and the shutter speed on the other.

5 Adjustment of the synchro "X" time lag

■ **Standard Value:** A range: Over 0.4ms B range: Over 2.0ms

■ **How to Adjust:**

1. Connect the synchro "X" lead wire of the shutter block as shown in the diagram of the connections between the testers and the shutter block, and set the shutter tester to "Curtain running direction: Down Function: X".
(Keep the 081 standard circuit tester at "Power: Off".)
2. Set the shutter dial to "X", and bend and adjust the "X" contact piece so that the shutter may show the standard value at the "A" range when it is released. In this case, confirm that the value measured at the "B" range remains within the standard value range.

Disassembly, Assembly and Adjustment

■ For disassembly, refer to the related pages in the reverse order as the contents of this manual are arranged in the order of procedures for assembling and adjusting.

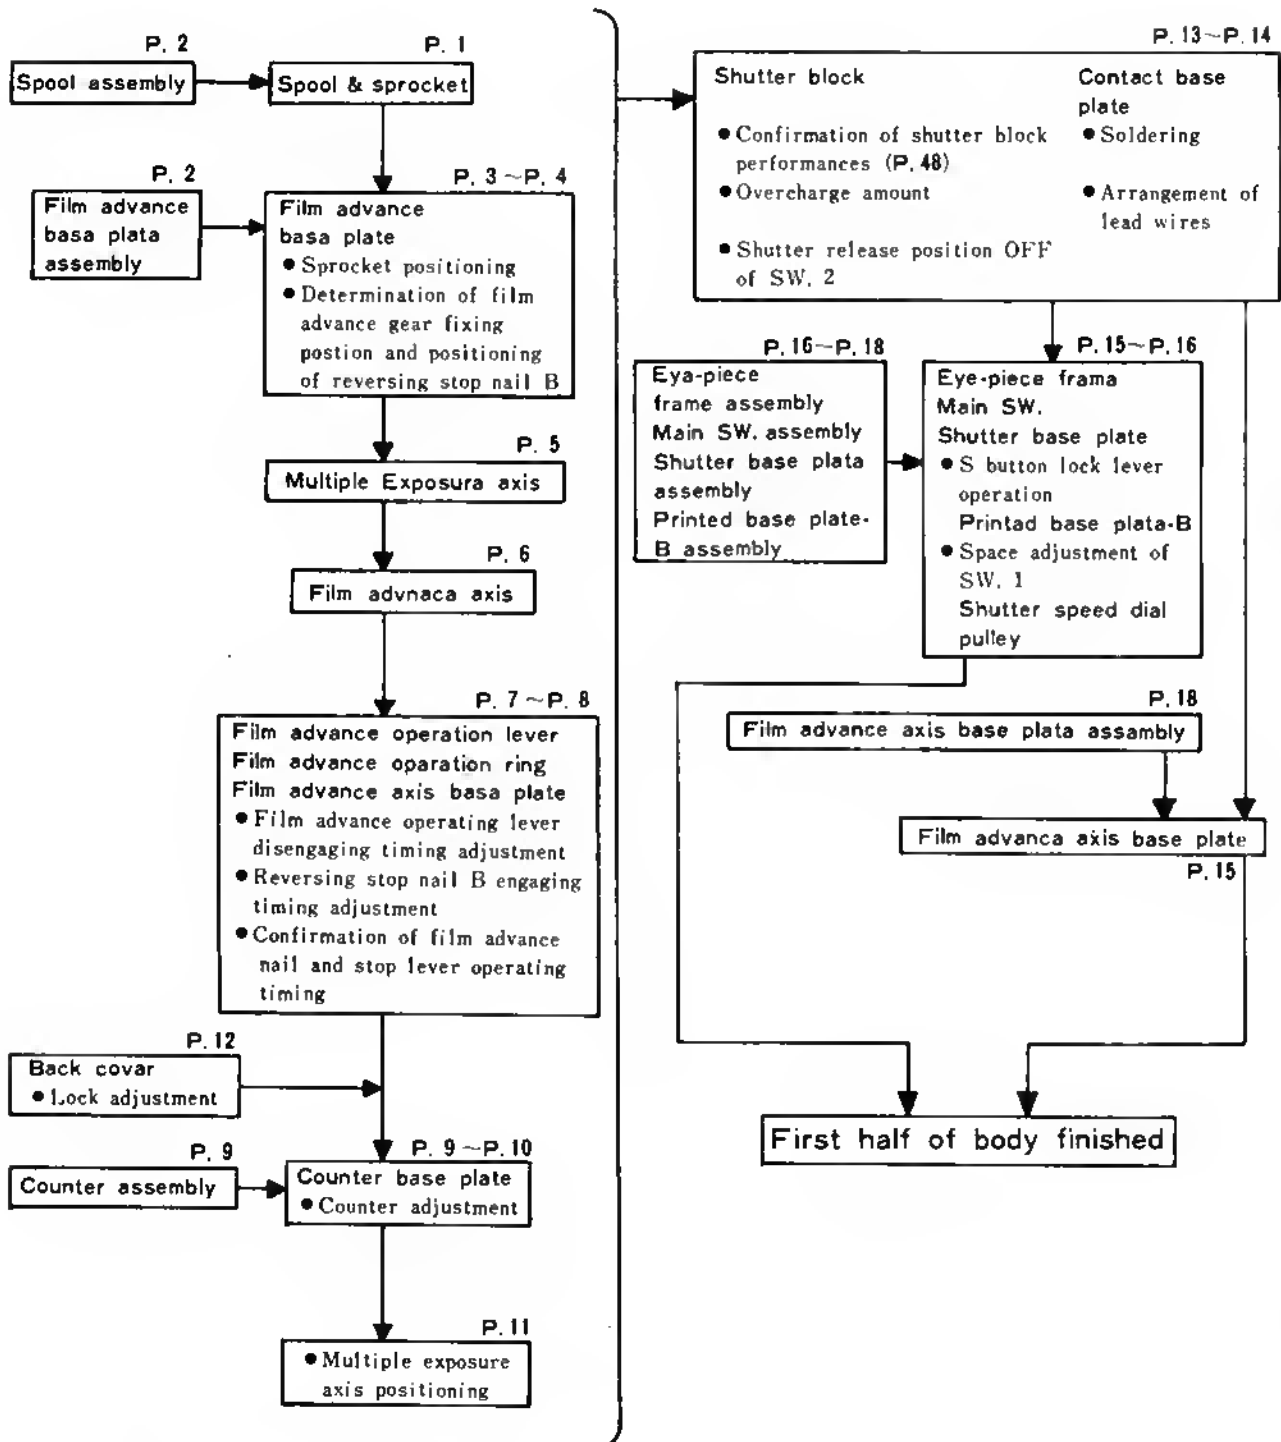

— Abbreviations —

- [D] : Disassembly note and reference.
- [A] : Assembly note and reference.
- [T] : Special tool No. and where to use it.
- [G] : Grease to be used and where to apply it.
- [B] : Bond to be used and where to bind.
- [C] : Caution in general.

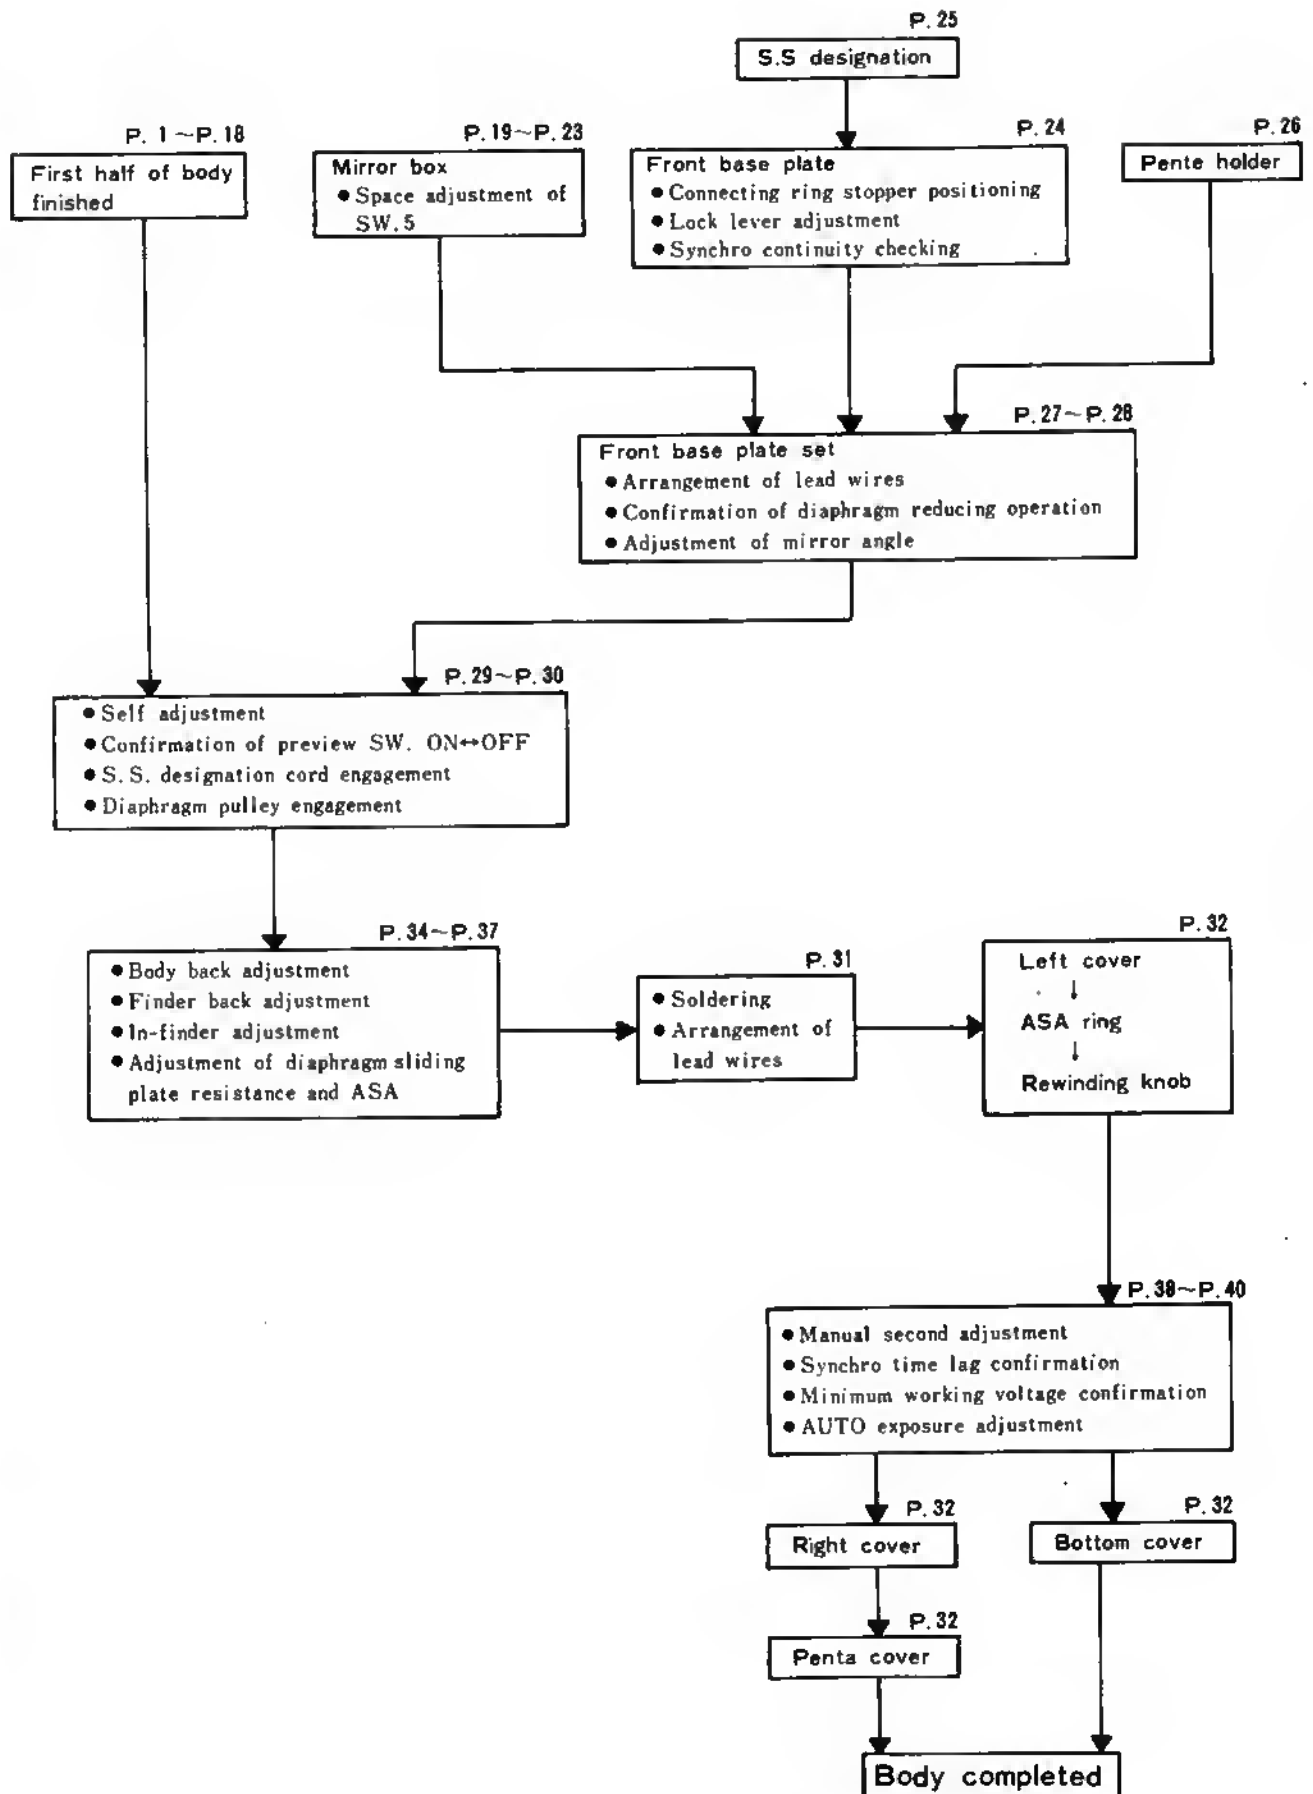

■ Disassembling Procedures Chart

■ First half of body

■ Second half of body to completion of body

Body 1 Spool & Sprocket

Spool

Fig- 1

Film Advance Base Plate

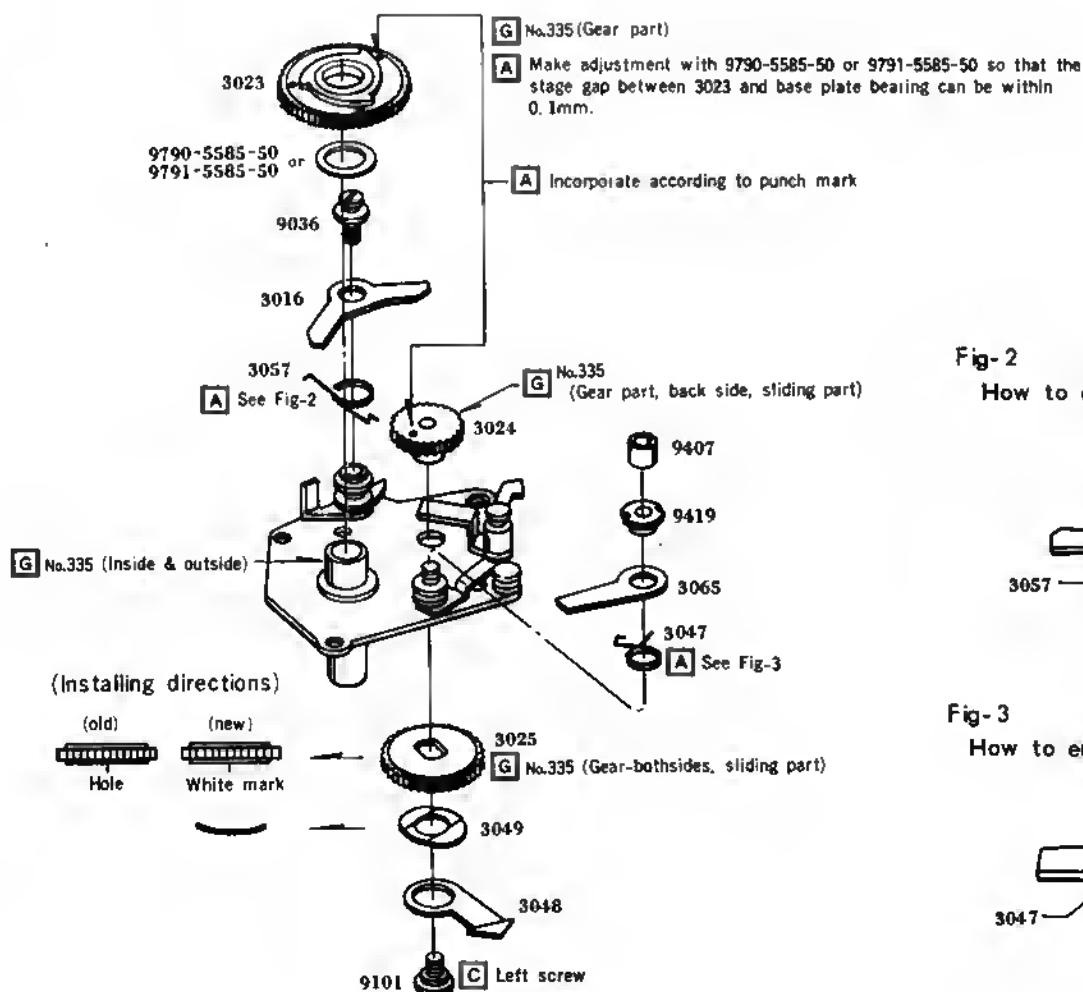

Fig- 2

How to engage 3057 SP

Fig- 3

How to engage 3047 SP

Body 2 Film Advance Base Plate

POINT-1 Incorporating Film Advance Base Plate and Positioning of Sprocket

With the body in the condition shown in the following figure, incorporate the film advance base plate set (with punch mark of gear fit) into the body. The sprocket axis should be pushed up with your finger.

Clutch pin of 0190 should be at 32°44' with body

When film advance base plate is attached, set the reversing stop nail A (3048) in the position shown in the figure.

Position of sprocket nail

After incorporating, determine the mounting position of film advance gear and position the reversing stop nail B.

■ Mounting Position of Film Advance Gear and Position of Reversing Stop Nail B

As shown in the figure to right, adjust the reversing stop nail collar (9419; eccentric) into the position where film advance gear (3023) connects with the reversing stop nail B (3065) and fits into the groove of the gear. Clamp it with 9407.

After the adjustment, check as follows:

■ Checkup after adjustment

Turn the spool once clockwise, and make sure that the sprocket (3041) is in the position shown in the figure at the right in which the reversing stop nail B (3065) has fallen into the film advance gear (3023).

Body 3 Multiple Exposure Axis

Fig-4 How to engage 3071
3019, 3055 SP.

■ Multiple exposure axis should be positioned after the counter base plate is incorporated.

Body 4 Film Advance Axis

Body-5 Film Advance Operation Lever, Film Advance Operation Ring and Film Advance Axis Base Plate

■ After assembling, make the following adjustments: (refer to next page 78)

- Adjustment of film advance operation lever disengagement timing.
- Adjustment of reversing stop nail B engagement timing.
- Checkup of operation timing of film advance nail and film advance stop lever.

Adjustment of Film Advance Operation Lever Disengagement Timing

• Purpose and caution:

This adjustment is to release the film advance lever (3007) at the same time as the completion of winding.

- Releasing too quickly will cause undercharge.
- Releasing too slowly will cause the film advance lever not to return.

• Preparation: Temporarily set the film advance lever

• Procedure: Carry out the adjustment according to the following procedures.

■ Before winding up condition

■ Condition at the completion of winding up

- ① In the state of completion of film advance, loosen 9037 and release 0126
- ② Push 3007 in the arrow direction as in the figure below and press it to the oval hole.
- ③ Push 0126 in the arrow direction as in the figure below, move it until 3007 is removed, and tighten 9037.
- ④ Wind up again and check that 0126 is released just before the winding up is completed. Afterward, tighten the lock screw at 9037.

Adjustment of Reversing Stop Nail B Engagement Timing

- ③ With the body bottom up, if 3065 is in either of the situations shown below in relation to 3023, loosen 9007 and make the clearance 0 by means of eccentric adjustment.

- ① Complete winding up.

- ② Push 0126 in the arrow direction and release the film advance lever as 3007 is contacted.

④ Confirmation:

0126 should be able to be released after winding up and 3065 being engaged with 3023, or at the same time thereof.

Checking of Operation Timing of Film Advance Nail and Film Advance Stop Lever

- ① Restore to the original state gradually from the wound up state.

- ② Check and ensure that the film advance nail is in the position shown above in which the film advance stop lever is engaged with the first notch.

- ③ Make sure that the film advance nail falls within the range where the film advance stop lever falls into the second notch.

- ④ Make sure that the film advance lever is in the completely returned position as shown above.

■ Lower side of body

Body 6 Counter Base Plate

Counter base plate

Fig-8 How to engage 3411 SP

Fig-9 How to engage 3423, 3426 SP

POINT-2 Incorporating of Counter Block

- Incorporate it according to the procedures shown in the figure below.

■ Confirmation after installing (Counter adjustment)

Carry out confirmation with the back cover closed. (For attaching the back cover, refer to P. 12)

- Confirmation-1: Check that (V groove pin) is in the second rut of counter gear in the position "S".

Normal

Abnormal-1

Abnormal-2

In case of Abnormal-1 and -2, bend the counter stopper to make adjustment.

- Confirmation-2: Check that the direction of (V groove pin) is as shown in the figure below, and if abnormal, change the engagement of 0145 with 3413 to make adjustment.

Normal

Abnormal-1

Abnormal-2

- Confirmation-3: From "S" position, wind up twice, and make sure that the counter graduation indicates "1".
Further wind up and check that there is no skipping, double feeding or stepping.
- Confirmation-4: Ensure the position of sprocket. (Refer to P. 4.)

Positioning of Multiple Exposure Axis

Proceed accordingly:

- ① Fix 3059 to the body as shown in the right drawing.
- ② Loosen 9611-1435-01 and bring 3054 to the same surface level with 3059.
- ③ Press 3059 in the arrow direction and while contacting it to 0150, tighten 9611-1435-01.

Checking after adjustment

- ① Fix the multiple exposure lever and film advance lever to the body.
- ② Normal shooting position of multiple exposure lever: Wind up and make sure that the spool and sprocket work normally.
- ③ Multiple shooting position of multiple exposure lever: Wind up and make sure that shutter charge is possible with the spool and sprocket inoperative.

Attaching Direction of Back Cover Pressure Plate

Refer to the drawings below:

Body 8 Shutter Block and Contact Holder Set

POINT-3 Incorporating of Shutter Block

Proceed as follows:

- ① Complete wind up procedure.
- ② Turn the shutter set lever in the arrow direction and charge the shutter.
- ③ Incorporate the shutter block so that the shutter set lever will be in the charge lever pin collar of the body and that the mirror restoring lever will be on the side of the reset lever.

After incorporating, perform the following checkup and adjustment in order:

- ① Check shutter block performances. (Refer to P. 48)
- ② Adjust overcharge amount. (Refer to the following)
- ③ Adjust shutter release position and OFF of SW. 2' (Refer to next page 14)

Overcharge Amount

Wind up gently and make sure that there is an overcharge amount exceeding 0.5mm after the release lever has engaged with the charge lever; and if not, replace the charge lever collar (9432: 4φ, 9434: 3φ, 9435: 3.5φ, 9437: 2.5φ) for adjustment.

■ Adjustment of Shutter Release Position and OFF of SW.2'

■ Proceed as follows:

- ① Temporarily set the top cover and film advance lever to the body.
- ② Shutter release position
 - Loosen 9612-1425-01 (two) so that the shutter can be released at the position where the shutter button is lowered by 1.5mm and make adjustment of 0112.
- ③ Make adjustment
 - Make adjustment so that it can be turned OFF 0.3mm ahead of the position in which the shutter is released.

- ### ■ After adjustment, carry out soldering of lead wires.
- (Refer to the following ④)

■ Arrangement and Soldering of Lead Wires

Body 9 Shutter Base Plate, Printed Base Plate-B, SS Dial Pulley, Rewinding Base Plate and Eye-piece Frame

Fig-11 How to engage 2024 SP.

Mirror Box-4

■ After incorporating this, make spacing adjustment of SW.5.

Space Adjust of SW.5

■ Mirror lowered.

Make adjustment by loosening 9408 and moving SW.5, horizontally.

■ Mirror raised.

Make sure that contact is positive.

Fig-20 How to engage 5110 SP.

Mirror Box-5

Positioning of Connecting Ring Stopper (1067)

- Using special tool (Tool No. 031-0005-76),
proceed as follows:

Move the connecting ring in the arrow direction, and at the position where 1067 is contacted tighten 9611-1725-01 and attach it with aron alpha.

B Aron alpha

T Tool No. 031-0005-79

Front Base Plate

Adjust of Lock Lever and How to Engage 1014SP

- After engaging SP (1014), make adjustment by means of eccentric pin, as shown above, so that the tip of 0574 may be within 0~0.2mm against 0575.

Checking of Synchro Contact Soldering and Continuity

- Proceed as follows:

POINT-5 Synchro Change SW. Installation

- Proceed according to the drawing below:

- After assembling, check the click feeling.

■ S. S. Designation Plate

■ Assembling order

■ Cross section of diaphragm-in-finder lens (5815) being attached.

Penta Holder

Printed base plate A set

Penta pressure plate set

Penta frame set

Fresnel lens set

■ Front Base Plate Set (Front Base Plate, Mirror Box and Penta Holder)

- After assembling
- ① Arrange lead wires. (Refer to Fig-21)
 - ② Check diaphragm reducing operation. (Refer to below)
 - ③ Adjust mirror angle. (Refer to next page 28).

■ Confirmation of Diaphragm Reducing Operation

Opening time: attach the standard lens and check that the opening is possible with F 16 aperture.

Diaphragm reducing time:

attach the standard lens and make sure that the minimum aperture is possible with F 16.

■ Mirror Angle

■ **Measuring device:** Mirror angle measuring instrument (Model MA-II) remodeled.

■ **Rated value:** $45^\circ \pm 20'$

■ **Adjustment of Front-and-Rear Position (Height) of Mirror.**

1. Set to the measuring instrument the set of mirror box and front base plate, make it face against the mirror height gauge and adjust the gauge tip by operating the mirror stopper (5109) along the arrow direction by means of the eccentric pin A so that the gauge tip may coincide when viewed.

2. Adjustment of mirror angle (45°)

- a) With the mirror box correctly facing against the autocollimator, release along the arrow direction the mirror angle adjuster plate (5131) by means of the eccentric pin B, look into the autocollimator, loosen the mirror angle adjustment plate screws (9022 and 9117) both on the mirror box so that the center of chart image may be on the cross hairs, make adjustment by operating the mirror angle adjustment plate (0514) along the arrow direction, and tighten the mirror angle adjustment plate screws (9022 and 9117).
- b) After the adjustment of mirror angle, while looking into the auto-collimator to check that the chart image does not change away from on the cross hairs, make adjustment by means of the eccentric pin B so that the mirror angle adjuster plate (5131) is along the counter-arrow direction contact 9311, and then tighten the positioning plate set screw (9116).

3. Checking the mirror operation

From the rear of the mirror box, operate the mirror several times and make sure that the chart image is within the rated values ($45^\circ \pm 20'$) and that the chart image does not change.

4. Checking the space of SW.5 contacts

After the adjustment of mirror angle, check the contact space of SW.5. (Refer to Page. 22)

Body 10 Front Base Plate

■ After assembling

- ① Hold down the preset lever (0519) with finger, release the shutter, raise the mirror gradually and check if the shutter can be clicked.
If the shutter cannot be clicked, then the shutter block is incorrect or faulty.
- ② Adjust the self-timer. (Refer to next page. 30)
- ③ Engage the diaphragm string. (Refer to next page. 30)
- ④ Engage the SS designation string. (Refer to next page. 30)

POINT-6 Incorporating of Front Base Plate Set

1. With the body in the state for film advance, attach SW 2, 3 and 4.

Be careful not to cause SW to be deformed.

2. After assembling the front base plate, click the shutter at "B" to ensure about ON and OFF of SW 2, SW 3 and SW 4.

3. Check ON and OFF of the diaphragm reducing SW.

Adjustment of Self-Timer

Engagement of Diaphragm Pulley String

Engage the diaphragm pulley string as shown in the drawing below.

Confirmation of ON-OFF of Diaphragm Reduction

Disconnect the lead wire (orange) of PV SW, connect a tester between the lead wire and body earth, turn the diaphragm button ON and OFF to check if PV SW turns ON and OFF.

Engagement of S.S. Designation String

Set the speed dial at 1000 and engage the string as shown in the drawing below.

- After the adjustment of the self-timer, the engagement of the diaphragm pulley string and SS designation string, carry out the following adjustments:

- Adjustment of the body back (Refer to Page. 34)
- Adjustment of the finder back (Refer to Page. 35)
- Adjustment of the in-finder (Refer to Page. 36)
- Confirmation of the diaphragm (Av) sliding resistance and ASA (Sv) operation (Refer to Page. 37)

- With the above all finished, carry out soldering and arrange lead wires. (Refer to Page. 31)

■ Soldering and Arrangement of Lead Wires

Body 11 Penta Cover, Left and Right Covers and Bottom Cover

■ First attach the left cover, exposure correction dial and rewinding knob to the body, make the following adjustments and, after the adjustments are finished, complete the body.

1. Manual split second timing adjustment (Refer to Page. 38)
2. Synchro time lag confirmation (Refer to Page. 39)
3. Minimum working voltage confirmation (Refer to Page. 40)
4. B.C. lamp voltage confirmation (Refer to Page. 40)
5. AUTO exposure adjustment (Refer to Page. 41)

Penta Cover

Exposure Correction Dial

Shutter Speed Dial

■ Adjustment of Finder Back

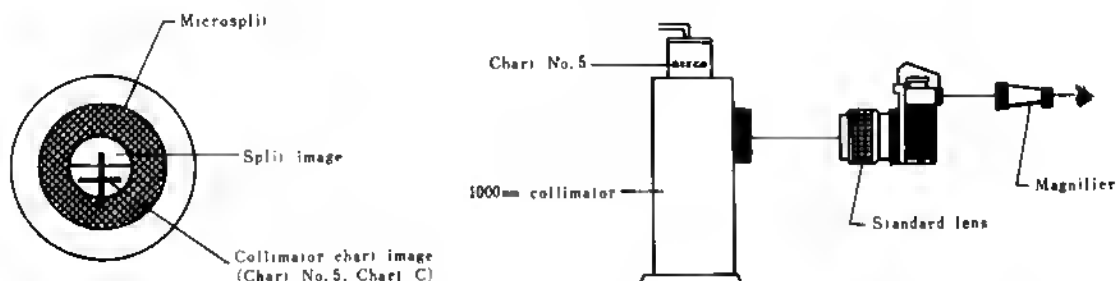

■ Measuring instruments:

- : 1000mm collimator (Model RC-1000 I, II, III)
- : Standard lens for adjustment of finder back (054-5202-79)
- : Magnifier

■ Standard value: $43.575 \pm 0.02\text{mm}$

■ Adjustment procedures:

1. Set the body in a position where the chart image can be seen as in the figure below, and set the visibility of magnifier to the chart image.

2. In a condition where white lines of the standard lens coincide, loosen 3 set screws of the penta holder (9111 left screws), raise and lower uniformly the focus adjusting nut B (9112) and, at the position where the vertical lines of the chart image coincide, tighten 9111.

3. After the adjustment, operate the mirror several times, rotate of the standard lens, and make sure that, when vertical lines of the chart image coincide, the standard values ($43.58 \pm 0.02\text{mm}$) are not exceeded and that no "half fuzziness" is observed.

Finder Adjustment

1. Adjustment of diaphragm-in finder

Attach the standard lens to the body, look in the finder with the diaphragm set at 5.6, make sure the position shown in the figures below is maintained and make adjustment if necessary.

$$\frac{1}{2}b \leq a \leq \frac{3}{2}b$$

- If F 5.6 is not in the center of the frame but deviated up or down, bend 0372 back and forth as shown in the figure for adjustment.

- If the frame of diaphragm-in finder is deviated higher or lower, make adjustment by sticking Scotch tape (0.1t) at the position of 0316 shown in the figure.

- If F 5.6 is not in the center of the frame but F 4 or F 8 is visible instead make adjustment by sliding 5036 horizontally and then glue it with paste.

2. Adjustment of speed-in finder.

With the speed dial set at 1/1000, look in the finder to make sure that it is in the position shown in the figure below and make adjustment if necessary.

- If 1000 is deviated to left or right away from the center of the frame, loosen 9622-1720-01 and slide 2009 for adjustment. Also make sure of A (auto).
- When 2009 is shifted for adjustment, if 2009 is deviated beyond the range shown in the figure, loosen 9611-1420-07 and shift the position of 5058 for adjustment.
- If 1000 is deviated up or down away from the center of the frame, make adjustment by replacing or removing 5044 as shown in the figure.

1000 Correct

1000 Slide clockwise 2009

1000 Slide counterclockwise 2009

5.6 1000 Correct

1000 5.6 High

5044 Replace

5045

5.6 Low

1000 Remove

■ Confirmation of Operation of Diaphragm (Av) Sliding and ASA (Sv)

■ Measuring instruments:

- : Digital Tester (Type 2507) or ohmmeter
- : Standard lens (50mm F 1.4)

■ Standard value: $300 \pm 50 \Omega$, at F 1.4 $60 \pm 20 \Omega$, without lens.

■ Adjustment procedures:

1. Adjustment of diaphragm (Av) resistance values.

Connect lead wires "Black" and "Orange" ASA diaphragm rub resistor (0232) as shown in the figure below, set the lens aperture at F 1.4 and by means of the diaphragm adjustment pulley (4104), adjust the resistance to the standard value (300 ± 50)

2. Diaphragm (Av) resistance value check.

Operate the diaphragm ring and check that no "leap" or "stalemate" in resistance value change is observed.

Make sure that, if the diaphragm is returned slowly or quickly back to F 1.4 from outside of F 1.4, the resistance value remains within the standard value.

Remove the lens and check if the resistance value remains $60 \pm 20 \Omega$.

3. ASA (Sv) check

Connect lead wires "Black" and "Yellow" of the ASA diaphragm rub resistor (0232) as shown in the figure below, attach the exposure correction dial, operate ASA connecting pin and make sure that no "leap" or "stalemate" exists in resistance value change.

Manual Split-Second Timing Adjustment

Measuring instruments:

- : 081 standard circuit tester Model SC-1 or constant-voltage DC power source Model E-1 or E-2
- : Shutter tester
- : Power source adapter (081-4204-79)

Standard value:

Shutter speed	Standard value	Allowable value ($\pm 0.1\text{Ev}$)
1/4	250ms	233~268ms
1/1000	0.98ms	0.91~1.05ms

Note: Allowable values are central values of the shutter tester.

Adjustment Procedures:

- Set the measuring instruments as shown in the figures below and set the power source voltage at 3.0V.

- Release the shutter at a speed of 1/4, and make adjustment by means of R_{10} (resistance for long split-second timing adjustment) so that the measured value may approach the standard (250ms). R_{10} loses speed when turned left and gains speed if turned right. (Refer to the figure below).

- After 1/4 adjustment, release the shutter at a speed of 1/1000, make adjustment by means of R_{12} (resistance for short split-second timing adjustment) so that the measured value may approach the standard (0.98ms). R_{12} gains speed if turned left and loses speed if turned right. (Refer to the figure below).

- When manual split-second timing is "OPENING" or "QUICK SHOOTING", for cause of trouble refer to the chart (P. 3)
- If printed base plate A is replaced, make adjustment after each of variable resistances (R_1, R_2, R_3, \dots) has been set approximately in the center.

■ Confirmation of Synchro Time Lag

■ Measuring instruments:

- : 081 standard circuit tester (Model SC-1) or constant-voltage DC power source (Model E-1 or E-2)
- : Shutter tester
- : Power source adapter (081-4204-79)

■ Standard value:

Synchro contact	Allowable value of time lag	
X	Range A	Over 0.4ms
	Range B	Over 2.0ms
FP	11~15ms	

■ Checking procedures:

1. Set measuring instruments as shown in the figures below:

2. Confirmation of "FP" time lag

Release the shutter at body shutter speed of 1/1000, synchro change SW (FP), shutter tester "FUNCTION" and power source voltage of 3V, and check that the measured value is within the standard (11~15ms).

3. Confirmation of "X" time lag

Release the shutter at body shutter speed of X and with synchro change SW (X), shutter tester "FUNCTION" and power source OFF, and check that the measured value is within the standard (Range A: over 0.4ms, Range B: over 2.0ms).

- If the measured value of time lag of FP and X each is beyond standard, check the shutter block. (Refer to P. 50)

Confirmation of Minimum Working Voltage

Measuring instruments:

- : 081 standard circuit tester (Model SC-1) or constant-voltage DC power source (Model E-1 or E-2)
- : Shutter tester
- : Digital tester (Type 2507) or DC ammeter
- : Power source adapter (081-4204-79)

Standard value

Shutter speed	Standard value	Allowable value ($\pm 0.45\text{Ev}$)
1/1000	0.98ms	0.71~1.33ms

Checking procedures:

1. Set the measuring instruments as shown in the figure below, and set the power source voltage at 1.70V. Release the shutter at a speed of 1/1000 and check that the measured value is within the standard (0.71~1.33ms).

- If the measured value is beyond the standard, readjust the manual split-second timing or check the shutter block.

Confirmation of B. C. Lamp Lighting Voltage

Measuring instruments:

- : 081 standard circuit tester (Model SC-1) or constant-voltage DC power source (Model E-1 or E-2)
- : Digital tester (Type 2507) or DC ammeter
- : Power source adapter (081-4204-79)

Standard value: Lighting at over 1.71~2.0V

Checking procedures:

1. Set the measuring instruments as shown in the figure below, and set the power source voltage at 1.7V, turn down B. C. SW in the arrow direction and make sure that B. C. lamp is "out". Next, set the power source voltage at 2.0V, turn down B. C. SW in the arrow direction and see if the B. C. lamp is lighted.

- If B. C. lamp is not put out or lighted, refer to the troubleshooting chart. (Refer to P. 2)

2 Adjustment of R_2 — Adjustment of diaphragm, ASA constant current $8\mu A$ —

■ Measuring instruments:

- : 081 standard circuit tester (Model SC-1) or constant-voltage DC power source (Model E-1 or E-2)
- : Digital tester Type 2507
- : Power source adapter (081-4204-79)
- : Standard lens (50mm F 1.4)
- : Screw-driver for brightness calibration

■ Adjustment procedures:

1. As shown in the figure below, connect lead wires for measuring to PV SW pattern and earth pattern of the printed base plate A (0432), and disconnect the soldering at "C" terminal of CdS front.
2. Set the measuring instruments as shown in the figure below and set the power source voltage at 3.0V.

Digital time counter POWER OFF

3. With Pv button of the body depressed (Pv SW: ON), measure voltages (mV) for lens F 2.8 and for lens F 16, and make adjustment by means of R_2 so that the difference will be of the value shown in the table below. Voltage decreases if R_2 is turned right and it increases if R_2 is turned left.

Ambient temperature	10~20°C	20~30°C	30~40°C
Voltage difference (mV)	87.0 ± 1	90.0 ± 1	93.0 ± 1

4. Confirmation of R_{av}

Turn the diaphragm dial and make sure that voltage differences per 1 Ev measured between F 2.8 and F 16 are as shown in the table below:

Ambient temperature	10~20°C	20~30°C	30~40°C
Voltage difference (mV)	17.4 ± 3	18.0 ± 3	18.6 ± 3

5. Confirmation of R_{sv}

Turn ASA dial and make sure that voltage differences per 1 Ev measured between 12 and 3200 are as shown in the table below:

Ambient temperature	10~20°C	20~30°C	30~40°C
Voltage difference (mV)	17.4 ± 3	18.0 ± 3	18.6 ± 3

③ Measuring of CdS Resistance Value and Selection of Rp

■ Measuring instruments:

- : Digital tester (Type 2507)
- : Brightness box (Model L-222 or L-223)
- : Standard lens (50mm F 1.4)
- : ND filter MINOLTA ND 50% for Adjustment

■ Measuring procedures:

1. As shown in the figure below, disconnect the soldering at Rp and terminal "C" of CdS (front and back) of the printed base plate A (0432).

Rp Remove solder while letting Rp radiate. (Use a pair of tweezers or the like).

2. Measuring of resistance value of $R_{LL\ BVS}$ (Resistance value should be within $88\sim340K\Omega$). Connect between "L"s of CdS (front and back) the measuring wire, remove the solder at "H" terminal of CdS front and connect the digital tester to "C" of CdS (front and back). Set the measuring range at " Ω " and measure the resistance value at Brightness Ev 5 (ASA 100).

3. Measuring of resistance value of $R_{LL\ BVS}$ (Resistance value should be within $16\sim40K\Omega$).

Carry out the same connection for CdS as described above, set ND filter to the body and measure the resistance value at Brightness Ev 11 (ASA 100).

4. $R_{HH\ BVS}$ Resistance Value Measurement (Resistance value should be within $128\sim480K\Omega$).

Maintain the brightness, ND filter and "C" of CdS all the same as in the case of $R_{LL\ BVS}$, solder the terminal "H" of CdS (front), remove the solder of measuring wire and measure and measure the resistance value.

■ Selection of R_p

1. Find the resistance value of R_p according to the attached data or calculating formula with each resistant value obtained in the measurement of RLL BV5 and RHH BV5.
2. Select from the table below the resistance closest to the resistance value obtained by the attached data or calculating formula and solder the terminal "C" and R_p .

R_p resistance ($K\Omega$)	R_p available ($K\Omega$)
$78 > R_p$	081-8312 (75 $K\Omega$)
$78 \leq R_p < 86$	081-8313 (82 $K\Omega$)
$86 \leq R_p < 95$	081-8314 (91 $K\Omega$)
$95 \leq R_p < 105$	081-8315 (100 $K\Omega$)
$105 \leq R_p < 115$	081-8316 (110 $K\Omega$)
$115 \leq R_p < 125$	081-8317 (120 $K\Omega$)
$125 \leq R_p < 140$	081-8318 (130 $K\Omega$)
$140 \leq R_p < 155$	081-8319 (150 $K\Omega$)
$155 \leq R_p < 170$	081-8320 (160 $K\Omega$)
$170 \leq R_p$	081-8321 (180 $K\Omega$)

4 Adjustment of R_s and R_L — Adjustment of low brightness and high brightness —

■ Measuring instruments:

- : 081 standard circuit tester (Model SC-1) or constant-voltage DC power source Model E-1 or E-2
- : Digital tester (Type 2507)
- : Brightness box (Model I.-222 or I.-223)
- : Power source adapter (081-4204-79)
- : Standard lens (50mm F 1.4)
- : Temporary cover for brightness calibration (081-1031-79)
- : Screw-driver for brightness calibration

■ Adjustment procedures:

1. As shown in the figure below, connect the measuring lead wires to IC terminals "6" and "7" of the printed base plate A (0432) and set the camera to the measuring apparatus.

2. Adjustment of R_s

Set the brightness box at Ev 5 (ASA 100), wait about 1 minute, and according to the table below make correction-for-temperature of V_{B00} voltage obtained by attached data or calculating formula from the voltage between IC terminals "6" and "7". Then turn R_s to coincide with the value of V_{B00} (mV) which has been corrected. Voltage drops if R_s turned right and it rises if R_s is turned left.

— Correction for temperature of V_{B00} —

Ambient temperature	$10 \pm 2.5^\circ\text{C}$	$15 \pm 2.5^\circ\text{C}$	$20 \pm 2.5^\circ\text{C}$	$25 \pm 2.5^\circ\text{C}$	$30 \pm 2.5^\circ\text{C}$	$35 \pm 2.5^\circ\text{C}$	$40 \pm 2.5^\circ\text{C}$
Correction value (mV)	-13.5	-9.0	-4.5	0	+4.5	+9.0	+13.5

3. Adjustment of R_L

Set the brightness box at Ev 15 (ASA 100), wait for more than 5 minutes, make correction-for-temperature according to the table below of the voltage value obtained by the attached data or calculating formula from the voltage between IC terminals "6" and "7". Then turn R_L to the voltage value of V_{B10} (mV) which has been corrected.

— Correction for temperature of V_{B10} —

Ambient temperature	$10 \pm 2.5^\circ\text{C}$	$15 \pm 2.5^\circ\text{C}$	$20 \pm 2.5^\circ\text{C}$	$25 \pm 2.5^\circ\text{C}$	$30 \pm 2.5^\circ\text{C}$	$35 \pm 2.5^\circ\text{C}$	$40 \pm 2.5^\circ\text{C}$
Correction value (mV)	-4.5	-3.0	-1.5	0	+1.5	+3.0	+4.5

* Adjust R_s and R_L repeatedly.

5 Adjustment of R_s

■ Measuring instruments:

- : 081 standard circuit tester (Model SC-1)
- : Digital time counter (Model TC-1)
- : Brightness box (Model L-222 or L-223)
- : Power source adapter (081-4204-79)
- : Standard lens (50mm F 1.4)
- : Temporary cover for brightness calibration (081-1031-79)
- : Screw-driver for brightness calibration
- : ND filter (Minolta ND 50% for adjustment)

■ Standard value:

- : $63.5\text{ms} \pm 0.1\text{Ev}$ (59.3~68.1ms) which is at brightness: Ev 10, ASA 100 (BV5): ASA sensitivity: 100 (SV 5) and diaphragm: F 8 (AV 6).

■ Adjustment procedures:

1. As shown in the figure below, connect measuring lead wires to SW 4 (+ side) and Mg. (- side) of the printed base plate, and set them to the measuring apparatus.

Setting of body and measuring apparatus

• Body

- Speed dial : AUTO
- ASA dial : 100
- Ev correction graduation: 0
- Pv button : depressed condition (Pv SW: ON)
- Power switch : ON
- Eye shutter: : shut

• Standard lens

- Distance ring : ∞
- Diaphragm : F 8
- ND filter : attached

• Digital counter

- SEP-COM SW: SEP
- Trigger level A-Ch: +1(V)
- B-Ch: +1(V)
- Trigger slope A-Ch: -
- B-Ch: +

• 081 standard circuit tester

- V-SEL SW: 3.0V
- SS-SEL SW: A

• Brightness box

- Brightness: Ev 11 (ASA 100)

2. Release the shutter and turn R_s so that the digital time counter will be within the standard values (59.3~68.1ms). Shutter speed gains if R_s is turned left.

6 Adjustment of R_3 — Adjustment of meter pointer —

■ Measuring instruments:

- : 081 standard circuit tester (Model SC 1) or constant-voltage DC power source (Model E-1 or E-2)
- : Brightness box (Model L 222 or L 223)
- : Power source adaptor (081-4204-79)
- : Standard lens 50mm F 1.4)
- : Temporary cover for brightness calibration (081-1031-79)
- : Screw-driver for brightness calibration

■ Standard value:

- | | | |
|--------------------|--------------------------|--------------------|
| [1] Brightness | : Ev 11 ASA 100 (BV 6) | } Pointer position |
| ASA sensitivity | : 100 (SV 5) | |
| Diaphragm aperture | : F 11 (AV 7) | |
| [2] Brightness | : Ev 15, ASA 100 (BV 10) | } Pointer position |
| ASA sensitivity | : 100 (SV 5) | |
| Diaphragm aperture | : F 5.6 (AV 5) | |

■ Adjustment procedures:

1. Set the measuring apparatus as shown in the figure below and set the power source voltage at 3.0V.

2. Set the body PV button depressed (PV SW: ON) and the standard lens at.
3. With the brightness box: Ev 11 (ASA 100) and the standard lens: F 11, look in the finder and make adjustment by means of R_3 so that the meter pointer be in the position for standard value (1). The pointer moves up if R_3 is turned right and moves down if R_3 is turned left.
4. With the brightness box: Ev 15 (ASA 100) and standard lens: F 5.6, look in the finder and check to see that the meter pointer is within the range of standard value (2).
5. If the meter pointer is not within the range of standard value (2) when Ev 15 (ASA 100) is set, make adjustment by parting with Ev 11 (ASA 100).

Shutter Block Performances Check

Checking points:

1. Confirmation of manual split-second timing
2. Confirmation of chattering of SW. 4
3. Confirmation of Mg attracting voltage
4. Confirmation of synchro time lag

1 Confirmation of manual split-second timing

Measuring instruments:

- : 081 standard circuit tester (Model SC-1)
- : Digital time counter (Model TC-1)
- : Shutter tester

Standard value:

"SS SEL" set position of 081 standard avometer	Indication of shutter tester		CR time
	Standard value	Allowable value	
1/1	1000ms	758~1320ms ($\pm 0.4\text{Ev}$)	1 s
1/4	250ms	189~330ms ($\pm 0.4\text{Ev}$)	251ms
1/1000	0.98ms	0.563~1.71ms ($\pm 0.8\text{Ev}$)	2 ms

Note: Allowable values are central values of shutter tester. For unevenness refer to inspection standard.

Checking procedures:

1. Incorporate the shutter into the body, and connect lead wires of SW. 4 and Mg of the shutter block to 081 standard avometer as shown in the figure below.

Setting of measuring instruments

- Digital time counter
SEP-COM SW: SEP
Trigger level A-CH: +1(V)
B-CH: +1(V)
Trigger slope A-CH: +
B-CH: +
- Shutter tester
Curtain traveling direction: DOWN
FUNCTION: EXP-T
- 081 standard avometer
SS SEL: 1, 1/4, 1/1000
V SEL: 3.0V

2. Check that measured values for 1/1, 1/4 and 1/1000 are within standard values.

Note: Digital time indication may vary depending on chattering of SW. 4.

2 Confirmation of Chattering of SW. 4

■ Measuring instruments:

- : 081 standard circuit tester (Model SC-1)
- : Digital time counter (Model TC-1)

■ Standard value:

1/1000	$1.0 \pm 0.05\text{ms}$
--------	-------------------------

■ Checking procedures:

1. Incorporate the shutter block into the body and connect lead wires of SW. 4 to the 081 standard avometer as shown in the figure below.

Setting of measuring instruments

• Digital time counter

SEP-COMSW: SEP

Trigger level A-CH: +1(V)

B-CH: +1(V)

Trigger slope A-CH: +

B-CH: -

• 081 standard circuit tester

SS SEL: S 4 CAL

S 4 SW: 1/1000

2. Check that measured values of 1/1000 and 1/60 are within the standard.

3 Confirmation of Mg attracting voltage

■ Measuring instruments:

- : 081 standard circuit tester (Model SC-1) or constant-voltage DC power source (Model E-1 or E-2)
- : Digital tester (Type 2507) or DC ammeter

■ Standard value:

- : At 1.68V, magnet should be attracted
- : At 1.67V, magnet may not be attracted

■ Checking procedures:

1. As shown in the figure below, connect lead wires of Mg of the shutter block, release the shutter at power source voltages of 1.68V and 1.67V to see if the standard is satisfied.

3 Confirmation of synchro time lag

■ Measuring instruments:

- : 081 standard circuit tester (Model SC-1)
- : Shutter tester

■ Standard value:

Synchro contact	Allowable time lag	
X	Range A	Over 0.4ms
	Range B	Over 2.0ms
FP	11~15ms	

■ Checking procedures:

1. As shown in the figure below, connect lead wires of SW, 4 and Mg of the shutter block to the 081 standard avometer and set them to the shutter tester.

2. Checking of FP time lag

Connect the "Blue" lead wire of the shutter block to the synchro terminal (+) side of the shutter tester, connect (-) side to the body earth, set the 081 standard avometer at ("V-SEV" dial: 3V, "SS SEI," dial: 1000), push "RESET SW" to release the shutter and then make sure that the measured value is within the standard (11~15ms).

3. Checking of X time lag

Connect the "Green" lead wire of shutter block to the synchro terminal (+) side of the shutter tester, connect (-) side to the body earth and turn "OFF" the power source of the 081 standard avometer. Release the shutter and check that the measured value is within the standard (Range A: over 0.4ms and Range B: over 2.0ms).

Wiring Schematic Diagram

Chart of Trouble Causes

■ Descriptions on Contents

1. The patterns described herein are single causes only but do not cover all possible causes. Make a comprehensive study of multiple causes of trouble based on the preceding single causes.
2. Herein mentioned are principally electrical causes of trouble, excluding mechanical causes.
3. The causes of trouble enclosed in a solid-line frame () indicate the state in the normal condition.
4. The causes of trouble enclosed in a dotted-line frame () indicate the state in an inferior condition.

■ Cautions on Trouble-Finding Work

1. Use the digital tester (Type 2507) basically as a measuring instrument; any other measuring instrument with an input impedance of $10M\Omega$ or more may be used.
2. Since the electric parts, such as ICs, diodes, resistors, condensers, etc., are considered trouble-free, put an emphasis on defective soldering, switches, etc., as the causes of trouble.
3. When confirming defective soldering do not press the parts unnecessarily or pull the lead wires forcibly.
4. The most suitable temperature of a soldering iron tip is $300\sim 350^{\circ}\text{C}$ at base plate A and about 250°C at base plate B. If, however, said temperature be unobtainable, be sure to finish soldering in a short time.

■ Contents

A. At high-speed shutter release (1/1000 sec., 1/500 sec.), variations occur in the shutter speed.	2
B. Batteries become dead quickly.	2
C. Poor sensitivity of meter (the meter does not indicate the variations equivalent to the varying aperture figure, ASA number, brightness, etc.)	2
D. AUTO Snap Shot..... (Snap shot implies that the shutter curtain does not open while the mirror remains lifted up.)	3
E. Manual Snap Shot	5
F. AUTO Release	5
(Release implies that the shutter curtain opens for 10 seconds or more after a shutter release.)	
G. Manual Release	7
H. Defective Work of Meter (the pointer does not move; unstable, slow in response, shaken off)	7
I. Battery checker do not light up or turn off.	7

■How to Short-Circuit SW 5

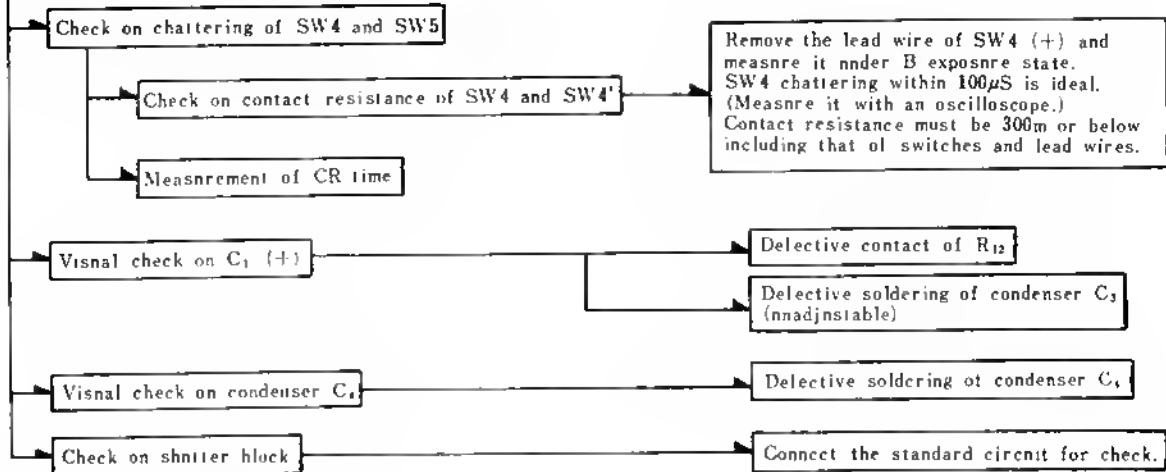

As SW5 is turned ON during shutter release only, short-circuiting it may sometimes be convenient in tracing the causes of trouble. On this occasion, use the lead wire as indicated in the drawing.

※Incidentally, use the constant-current power source as short-circuit of SW5 consumes 13~15mA current at all times.

■Voltage at Electric Circuits of Principal Check Position

Voltage Check Position	Before Shutter Release	During Exposure	After Exposure	Remarks
SW1± SW3+ C ₂ + SW ₅ +	3.0V	3.0V	3.0V	Voltage falls somewhat during exposure while the batteries are in use.
C ₁ +SW2'	Tv 4 550~590mV Mean value ≈570mV	Tv 4 550~590mV	Tv 4 550~590mV	Some variations occur depending on light quantity.
R ₁₂ + SW5-	0V	3.0V	0V	Voltage falls somewhat during exposure while the batteries are in use.
C ₁ - C ₃ -	0V	0V	0V	
C ₂ - SW3-	3.0V	At AUTO exposure 3.0→2.5→0V At manual exposure 3.0→1.6→0V	3.0V	The instantaneous 0V display cannot be judged by the digital tester.
C ₃ + R ₁₂ -	0V	0→1.7~2.5V	0V	When SW5 is ON, 0→0.02V
R ₁₀ com (Trigger level)	0V	At AUTO exposure ≈2.5V At manual exposure ≈1.6V	0V	
Mg-	0V	0→0.08→≈3.0V or less	0V	When the magnet turns off, the counter current becomes about 20V momentarily.
Rsv	Av 6 } 120~150mV Sv 5 } Mean value ≈134mV	120~150mV	120~150mV	Release photometering with some variations in temperature.
Me+	4S-19mV 1/15S-65mV 1/1000S-135mV	Falls somewhat	4S-19mV 1/15S-65mV 1/1000S-135mV	Within the photometering range
Current Consumption	≈125~200μA	≈15mA	≈125~220μA	

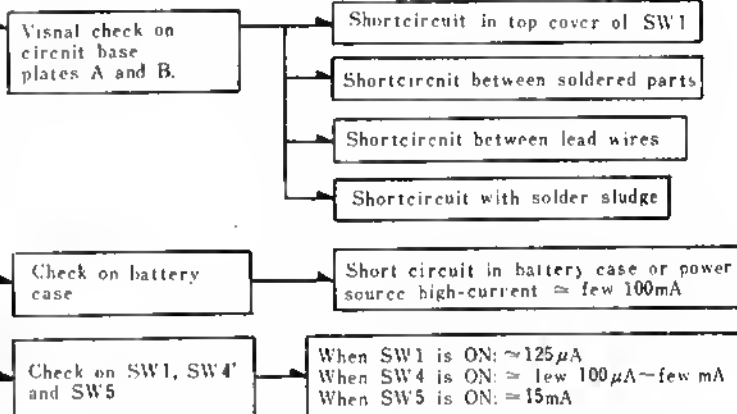

A. At both Automatic and manual snap shot, shutter speed variations occur at high speed shutter release (1/1000S, 1/500S)

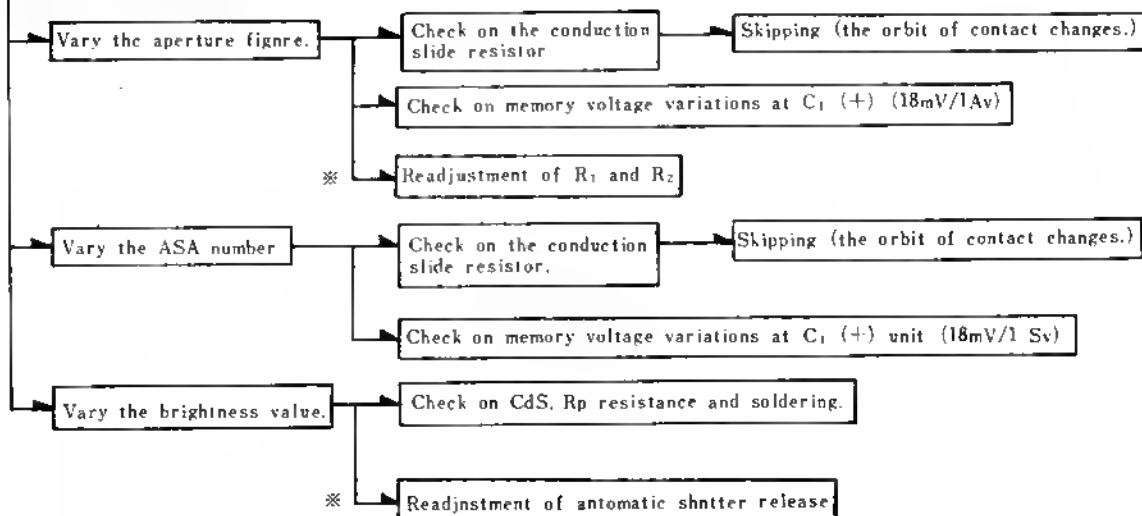

B. Batteries becomes dead quickly.

Set the power source adaptor in the battery box to read the variations of current consumption

Photometering state (SW1, ON) $\approx 125 \sim 220 \mu$ A
 Exposing state (SW5, ON) ≈ 15 mA
 When SW1 is OFF $\approx 0 \mu$ A

C. Power Sensitivity of Meter (the meter does not indicate the variations equivalent to the varying aperture figure. ASA number, brightness etc.)

1. How to Confirm Manual Time

■ Measuring Instruments

- : 081 Standard Circuit Tester (Model SC-I)
- : Digital Time Counter (Model TC-I)
- : Shutter Tester

■ Standard Value

Set Position of "SS SEL." of 081 Standard Circuit Tester	Indication of Shutter Tester		CR Time
	Standard Figure	Allowed Figure	
1/1	1000ms	758 ~ 1320ms ($\pm 0.4\text{Ev}$)	1 sec.
1/4	250ms	189 ~ 330ms ($\pm 0.4\text{Ev}$)	251ms
1/1000	0.98ms	0.563 ~ 1.71ms ($\pm 0.8\text{Ev}$)	2 ms

■ How to Confirm

1. Unsolder the lead wires of SW4 (+side) and Mg (+and- sides) of circuit base plate plate B (0602) and set them to the tester as shown in the following diagram.

● Digital Time Counter

SEP-COM SW: SP

Trigger Level A-CH: +1 (V)

B-CH: +1 (V)

Trigger Slope A-CH: +

B-CH: +

● Shutter Tester

Curtain Running Direction: DOWN

FUNCTION: EXP-T

● 081 Standard Circuit Tester

SS SEL: 1, 1/4, 1/1000

V SEL: 3.0 V

2. Select a shutter speed by the "SS SEL" dial of the 081 standard circuit tester. Press the "RESET" SW of the 081 standard circuit tester, release the shutter, and Confirm that the measured figure of 1/1, 1/4 and 1/1000 remains within the range of the rated figures.
3. If the measured figures of 1/1, 1/4 and 1/1000 don't remain within the range of the rated figures, check the shutter block.

2. How to Confirm Chattering of SW4

■ Measuring Instruments

: 081 Standard Circuit Tester (Model SC-I)

: Digital Time Counter (Model TC-1)

■ Standard Value

1 / 1000	$1.0 \pm 0.05\text{ms}$
1 / 60	$15 \pm 0.2\text{ms}$

■ How to Confirm

1. Unsolder the lead wire of SW4 (+side) of the circuit base plate B (0602) and set it to the tester as shown in the following diagram.

• Digital Time Counter

SEP-COM SW: SEP

Trigger Level A-CH: +1 (V)

B-CH: +1 (V)

Trigger Slope A-CH: +

B-CH: -

• 081 Standard Circuit Tester

SS SEL: S4 CAL

S4 SW: 1/60, 1/1000

2. Set "S4 SW" of the 081 standard circuit tester to 1/1000 and 1/60, press the "RESET SE" release the shutter, and confirm that the measured figures of 1/1000 and 1/60 remain within the range of the rated figures.
3. If the measured figures of 1/1000 and 1/60 don't remain within the range of the rated figures, check the shutter block.

INSPECTION STANDARDS

■ The inspection standards provided for hereinunder shall be applied to the inspection made by the Service divisions on the repaired cameras but shall be inapplicable to the new cameras inspected at delivery or arrival. The appearance of such cameras shall be inspected based on its appearance at the time of the repairs being requested therefor as the standards. Follow the following standards for the replacement parts therefor.

Item	Place	Contents	How to confirm and adjust (Pages referring to disassembling, assembling and adjusting)
Film Advance	Film advance lever	Unsmooth film advance, vertical looseness, backlash, abnormal noise, winding torque of 4kg/cm or below (without film)	P. 7
	Spool	Operation: Unsmooth; whether film is correctly wound; slip load 200~300g	P. 1~2
	Sprocket	Operation: Slipping, backlash after film winding, slipping after pressing the rewinding button.	P. 1~4
Film Rewinding	Film rewinding button	Operation: Shearing, release, hold.	P. 3~4
	Film rewinding crank	Operation: Eccentricity, creak, roughness, ineffective SP	P. 32~33
Film Counter	Forward and backward feed	Operation: No advance, standstill, skipping, no backward move, hold, scale deviation.	P. 10
Film Signal	Forward and backward feed	Operation: Whether a signal is provided at the initial frame indicated by the counter, as shown in the drawing. The signal does not disappear at 36+3 frames. 	P. 10
Multiple Exposure	Multiple exposure lever	Functioning: Returns after film has been wound until it clicks. Spool and sprocket run idle after the lever is set.	P. 11
Shutter	Shutter button	Shutter load: 200~400g. Operation is unsmooth; shock.	P. 9
	Functions of curtain	Abnormal noise, thrust; curtain overlapping.	P. 13
	Shutter speed	Allowance: refer to P. 3. Irregular exposure: within 0.4EV.	P. 38~46
	Shutter speed dial	Functioning: Unsmooth; clicks; auto-lock; deviation of scales.  (The center of a letter must come to the index.)	P. 33
	Self-timer	Set lever: Deviated position; defective setting; shutter release; rubbing with button.  The lever must work correctly on the position marked in the left drawing. Functioning: irregular and unsteady work; 2-stage release; does not work.	P. 30
	Synchro	Conductivity: Whether it may unfailingly ignite; whether any short-circuit in winding film; accessory shoe can be conductive. Functioning: X-FP synchro selector switch.	P. 39
		Insulation resistance: 10MΩ or more (DC 250V insulation resistance gauge is used.)	
		Delay time: FP contact 11~15ms (at $\frac{1}{1000S}$) X contact A lag 0.4ms or over (for X) B lag 2.0ms or over	
		Contact efficiency: FP contact 60% (measured on a measuring time of 2.5ms and 1/1000s.) X contact 50% (measured on a measuring time of 1 ms X.)	

Item	Place	Contents	How to confirm and adjust (Pages referring to disassembling, assembling and adjusting)
Finder	Nominal view	Inclination of image: 1° or below. ∞ coinidence; lazy on one side; fog; rubbing the mask.	P. 35
	Display	The shutter speed and aperture are displayed in the frame with no adjacent letter seen therein; digital scale free dust, stains.	P. 36
Mirror	Angle	Stop position: $45^\circ \pm 30^\circ$ Rising position: The mirror must be behind the flare shield plate.	P. 28
Back Cover	Operation	The back cover automatically lifts up when the rewinding knob is pulled up. It closes firmly with no looseness.	P. 12
	Press board	Flatness: $0 \sim 0.02\text{mm}$ (concave)	
Exposure meter	Pointer	Functioning: Hold, deviation, sticking. 0 Position 	P. 47
	Index difference	ASA 100EV 5 F 5.6 1 sec. 9 F 4 1/30 sec. 11 F 4 1/125 sec. Allowance $\pm 0.7\text{EV}$ 15 F 5.6 1/1000 sec.	
	Exposure error	(ASA aperture value is the same as the index error at the same measuring point.) Allowance: $\pm 0.8\text{EV}$, Variation range: 0.6EV	
	Power switch	ON-OFF operation Shutter button lock when the switch is off.	P. 16
	Diaphragm button	The meter is on when the diaphragm button is released or set. Functioning: smooth; engaging condition.	P. 20
	ASA change ring	Functioning: engaging condition, index deviation. ASA 25~800 transfer error $\pm 0.3\text{EV}$ Other error $\pm 0.5\text{EV}$	P. 37
	Exposure correction ring	Functioning: Click, index deviation.	P. 33
Focus		Body back: 43.70 ± 0.02 (until pressure plate face) Finder back: 43.575 ± 0.025	P. 34
Lens	Helicoid	Functioning: Unevenness, crack, looseness, and loaded. Scale deviation: The index center is indicated within $\frac{1}{4}$ of the width of letter.	—
	Diaphragm	Functioning: Whether it smoothly fractions from release to F 16. Whether any residual impellers, decentering, deformation, etc. are found.	—
Others	Eye-piece shutter lever	Functioning: looseness, click and clearance.	P. 32
	Attaching and detaching lens	Functioning: Whether said processes feel heavy or light, whether lock is unworkable or loose, etc.	P. 24
	Battery box	Contact of battery and corrosion of the contact pieces, etc.	P. 13

Standard Values of Shutter Speed ($\pm 0.5\text{EV}$)

Standard \ Shutter Speed	4 sec	2	1	1/2	1/4	1/8	1/15	1/30	1/60	1/125	1/250	1/500	1/1000
Standard Values	4.00s	2.00s	1.00s	500ms	250ms	125ms	62.5ms	31.3ms	15.6ms	7.81ms	3.91ms	1.95ms	0.977ms
Maximum Limit Value	5.66s	2.83s	1.41s	707ms	354ms	177ms	88.4ms	44.3ms	22.1ms	11.0ms	5.53ms	2.76ms	1.38ms
Minimum Limit Value	2.83s	1.41s	707ms	354ms	177ms	88.4ms	44.3ms	22.1ms	11.0ms	5.53ms	2.76ms	1.38ms	0.691ms

Irregular Exposure Based on Shutter Speed

The exposure time in A-Range and C-Range on both sides of B-range (center) remains within $\pm 0.3\text{EV}$ ($+23\%$ / -19%). The maximum and minimum values of the respective ranges shall be within 0.4EV ($+32\%$ / -25%).

(1) In the case of mid-expanding trend

$$\left(\frac{A \text{ Range} - B \text{ Range}}{\text{or } C \text{ Range}} \right) \div B \text{ Range} \times 100 = \text{within } (+23\% / -19\%)$$

(2) In case of end-narrowing or endexpanding trend

$$(\text{Min. value} - \text{Max. value}) \div \text{Max. value} \times 100 = -25\%$$

$$(\text{Max. value} - \text{Min. value}) \div \text{Min. value} \times 100 = +32\%$$

[Example]

Where A range = 0.80ms, B range = 1.00ms and C Range = 0.70ms,

$$(0.70 - 1.00) \div 1.00 \times 100 = -30\%$$

This value is out of the standards.

ANNEXED DATA (How to Obtain $R_P \cdot V_{BV0} \cdot V_{BV10}$)

1. How to Obtain Said Data by Calculating Expressions

R_P , V_{BV0} and V_{BV10} will be obtained through the application of R_{LLBV0} , R_{LLBV5} and R_{HHBV5} obtained from the "measurement of CdS resistance value" as described in Item C of Auto-Exposure Control.

$$\gamma = \frac{R_{LLBV0}}{R_{LLBV5}} \dots \dots \dots (1) \quad \alpha = \frac{R_{HHBV5}}{R_{LLBV5}} \dots \dots \dots (2)$$

The values calculated in the expressions (1) and (2) shall be within ranges of $\gamma = 5.5 \sim 8.5$, $\alpha = 8 \sim 12$.

$$R_P = (5.432 + 0.0638 \times \gamma) \times \left(\frac{\alpha}{1 + \alpha} \right)^2 \times R_{LLBV5} - (11 \times (8.5 - \gamma) \times \frac{R_{LLBV5} - 8}{22}) \dots \dots \dots (3)$$

$$V_{BV5} = \frac{755.8}{\gamma} + 4.32 \times \alpha - 336.2 \dots \dots \dots (4)$$

$$V_{BV0} = V_{BV5} - 91 \dots \dots \dots (5) \quad \text{Note: In relation to temperature correction, the calculated value (-) will be replaced with (+) value.}$$

$$V_{BV10} = V_{BV5} + 92 \dots \dots \dots (6) \quad \text{Note: In relation to temperature correction, the calculated value (+) will be replaced with (-) value.}$$

Note: The numeral 91 or 92 in the expression (5) or (6) is a value obtained from the measurement made at the ambient temperature of $25^\circ \pm 2.5^\circ \text{C}$, and it must be corrected when obtained by the measurement performed at the ambient temperature out of $25^\circ \pm 2.5^\circ \text{C}$.

2. How to Obtain Said Data from Numerical Chart

To obtain R_P , V_{BV0} , and V_{BV10} , look for R_{LLBV0} , R_{LLBV5} and R_{HHBV5} obtained by the "measurement of CdS resistance value" as described in Item C of Auto-Exposure Control, in said order.

- ① Count fractions over 0.5 as one and disregard the rest of the decimals of R_{LLBV5} and open the page where said value is contained.
- ② Select the column containing the value or an approximate value of R_{HHBV5} on the page stating the value of R_{LLBV5} .
- ③ Select the line containing the value or an approximate value of R_{LLBV0} in the column stating the value or an approximate value of R_{HHBV5} .
- ④ R_P , V_{BV0} and V_{BV10} in the line containing the value or an approximate value of R_{LLBV0} are the values required to be obtained.

(Example) Where R_{LLBV0} : 185K Ω , R_{LLBV5} : 25.5K Ω and R_{HHBV5} : 245K Ω .

- ① R_{LLBV5} : 25.5K Ω will be 26K Ω through counting fractions over 0.5 as one and disregarding the rest thereof; then open Page 4.
- ② Since R_{HHBV5} : 245K Ω is not found in any column on Page 4, apply the column stating an approximate value of 247K Ω .
- ③ Since no line containing R_{LLBV0} : 185K Ω exists in the column mentioning an approximate value of 245K Ω of R_{HHBV5} , apply the line containing 182K Ω .
- ④ R_P : 112K Ω , V_{BV0} : 278mV, and V_{BV10} : 95mV are obtained from the line containing the approximate value of 182K Ω of R_{LLBV0} .

Note: Select the expressions or numerical chart to obtain R_P , V_{BV0} and V_{BV10} .

This parts list comprises exclusive parts for the 087.

Please use the parts list of 081(X E), 082(X E - 1) and 086(X E - 7) for all other parts unlisted here, because they are common to 081, 082 and 086 respectively.

この部品表は 087 (X E - 5) 専用部品のみをまとめたものです。この部品表以外の部品については 081 (X E)、082 (X E - 1)、086 (X E - 7) と共通ですので 081、082、086 パーツリストをご利用下さい。

Part No. & Part name	Sketch	Unit
087 - 0150 - 01 Film advance axis bearing base plate set 巻取軸受台板セット		1
087 - 0270 - 01 Shutter dial base plate set シャッターダイヤル台板セット * Coupled elements (except 087-2010) are common to 087-0270 087-2010 以外の結合内容は 081-0270 と共通		1
(087 - 0270 - 01) 087 - 2010 - 02 Pulley holder プーリーホルダー		1
087 - 0360 - 01 X E - 5 Top cover set (Right) X E - 5 上カバーセット (右) * Top cover tape (#1042) are common to 081 上カバー保護テープ (#1042) は 081 と共通		1
(087 - 0360 - 01) 087 - 0361 - 01 Counter window set カウンター窓枠セット		1

Part No.	Part Name	Part No.	Part Name
087 - 0883	Penta prism set ペンタプリズムセット	081 - 0883	Penta prism set ペンタプリズムセット
087 - 1006	Front cover 前カバー	081 - 1006	Front cover 前カバー
081 - 1028	Top cover second plate(Right) 上カバー補助板(右)	081 - 0317	Top cover second plate(Right) 上カバー補助板(右)
087 - 1033	Penta cover receiver ペンタカバー受け		Uselessness (使用せず)
087 - 1050	Eye-piece cap アイピースキャップ		Uselessness (使用せず)
087 - 1053	Accessory shoe spring アクセサリシューズスプリング	081 - 1053	Accessory shoe spring アクセサリシューズスプリング
087 - 2009	Shutter speed dial pulley S.Sダイヤルプーリー	081 - 2009	Shutter speed dial pulley S.Sダイヤルプーリー
087 - 2010	Pulley holder プーリーホルダー	081 - 0273	Pulley holder set プーリーホルダーセット
087 - 3015	Film advance nail spring 巻取爪スプリング	081 - 3015	Film advance nail spring A 巻取爪スプリング A
087 - 3066	Film advance lever decoration ring 巻上げレバー飾り環	081 - 3066	Film advance lever decoration ring 巻上げレバー飾り環
087 - 3073	Film advance lever washer 巻上げレバーワッシャー	081 - 3073	Film advance lever washer 巻上げレバーワッシャー
087 - 5003	Space plate 視野枠	081 - 5003	Space plate 間隔板
087 - 5005	Restriction frame - A 制限枠 A	081 - 5005	Restriction frame - A 制限枠 A
087 - 5027	CdS holder support plate CdS 前クラ保持板		Uselessness (使用せず)
087 - 5052	Meter figure plate メータ目盛板	081 - 5052	Meter figure plate メータ目盛板
081 - 5068	Penta pressure plate ペンタ押え板	081 - 0455	Penta pressure plate ペンタ押え板
087 - 5805	Fresnel lens 焦点板	081 - 5805	Fresnel lens 焦点板
087 - 8414	Lead wire (Brown L = 140mm) リード線 (茶 L=140mm)		Uselessness (使用せず)
087 - 9234	Body light shield pin - A ボデー遮光ピン A		Uselessness (使用せず)
087 - 9235	Body light shield' pin - B ボデー遮光ピン B		Uselessness (使用せず)
9612 - 1430 - 12	Phillips type screw (Use to 5027)(5027 取付用)		Uselessness (使用せず)
9612 - 1740 - 12	Phillips type screw (Use to 087-0603)(0603 取付用)	9611- 1740 - 12	Phillips type screw (Use to 081-0603)(0603 取付用)

Parts List except that 081 series.

Part No. & Part name	Sketch	Unit
087 - 5027 - 01 CdS holder support plate CdS 前クラ保持板		1
087 - 5068 - 01 -02 Penta pressure plate ペンタ押え板		1
087 - 5805 - 01 Fresnel lens 焦点板		1
087 - 8414 - 01 Lead wire (Brown L = 140mm) リード線 (茶 L = 140mm)		1
087 - 9234 - 01 Body light shield pin - A ボデー遮光ピンA		1
087 - 9235 - 01 Body light shield pin - B ボデー遮光ピンB		2

Part No. & Part name	Sketch	Unit
9612 - 1430 - 01 Phillips type screw 十字穴付きなべ頭小ねじ	 <p>A perspective sketch of a rectangular base plate with a small raised rectangular section in the center. Two screws are shown being inserted into the front corners of the plate.</p>	2
9612 - 1740 - 12 Phillips type screw 十字穴付きなべ頭小ねじ	 <p>A perspective sketch of a Minolta camera body. Four screws are shown being inserted into the top, bottom, and side mounting points. The 'minolta' logo is visible on the front of the camera body.</p>	4

Part No. & Part name	Sketch	Unit
087 - 0883 - 01 Penta prism set ペンタプリズムセット		1
087 - 1006 - 01 Front cover 前カバー		1
087 - 1028 - 02 Top cover second plate (Right) 上カバー補助板 (右)		1
087 - 1033 - 02 Penta cover receiver ペンタカバー受け		1
087 - 1050 - 01 Eye-piece cap アイピースキャップ		1
087 - 1053 - 02 Accessory shoe spring アクセサリーシューズスプリング		1

Part No. & Part name	Sketch	Unit
087 - 2009 - 01 Shutter speed dial pulley S.S ダイアルプーリー		1
087 - 3015 - 01 Film advance nail spring 巻取爪スプリング		1
087 - 3066 - 01 Film advance lever decoration ring 巻上げレバー飾り環		1
087 - 3073 - 01 Film advance lever washer 巻上げレバーワッシャー		1
087 - 5003 - 01 Space plate 視野枠		1
087 - 5005 - 01 Restriction frame - A 制限枠 A		1

Part No. & Part name	Sketch	Unit
087 - 0440 - 01 Eye-piece frame set 接眼枠セット		1
087 - 0452 - 01 Penta frame set ペンタ枠セット		1
(087 - 0452 - 01) 087 - 5052 - 03 Meter figure plate メータ目盛板		1
087 - 0571 - 01 Front base plate set 前枠セット		1
087 - 0603 - 01 Penta prism cover set ペンタカバーセット		1
* Coupled elements are common to 081-0603 結合内容は 081-0603 と共通
